Operation Instruction

Model:A6

Contents

INTRODUCTION

A6 FDM 3D printer can print CAD 3D printer model to real . A6 uses Acrylic to build its frame while it uses linear bearings , belts and threaded rods to build X , Y , Z axis .

It enables A6 to print steadily with no vibration .

Note:

1. All statement included in this Instructions have been checked carefully , if any typographical errors or misunderstanding , we have the final interpretation .
2. No noification if any update .

A. Security Considerations

To avoid danger when using 3D printer , please pay attention to precautions below .

Danger

During Operation , the maximum temeprature of nozzle can be 260 □ while hotbed can be 100 □ . For your safety , during printing or cooling down , do not touch the nozzle , hotbed and models under printing . Power works at 110V/220V 50HZ AC and supply ground needed . Do not use other power supply , or it may cause components damage , fire or electric shock . And we take no responsibility for this .

Warning

We suggest wering protective goggles when removing auxiliary support materials . Some filaments will emit slight irritant gases , so we suggest to use 3D printer in a ventilated environment .

Note: ABS filament will emit a bit toxic gases when it melts .

B. Product Details

1.Specifications

Model：A6	Nozzle diameter： 0.4mm
Layer thickness：0.1-0.3mm	Machine size： 480*400*400mm
Printing speed：10-120mm/s	Machine weight：7.6KG
X Y axis position accuracy：0.012mm	Packing size：510mm*490mm*172mm
Z axis position accuracy：0.004m	Gross weight：9.5KG
Printing material：ABS,PLA	Build size：220*220*240mm
Material tendency：PLA	LCD screen：12864 LCD
Filament diameter ：1.75mm	Offline printing：TF CARD
Software language：Multi-Language	File format：STL、G-Code、OBJ
Function of support：automatically	OS：windows(linux、mac)
Software： Cura	Working condition：10-30，Humidity 20-50%

C. Cura Software

1.Installation of Cura14.07 a:

Where can I find the software?

1) TF card with shipment; 2) download from Internet; b:

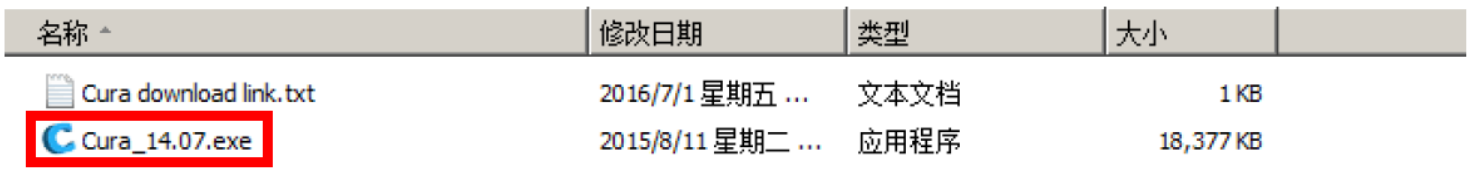
Installation process

1) From TF card with shipment

Insert TF card and open the file

1.1 File location in the TF card

1)Insert SD card , open the file

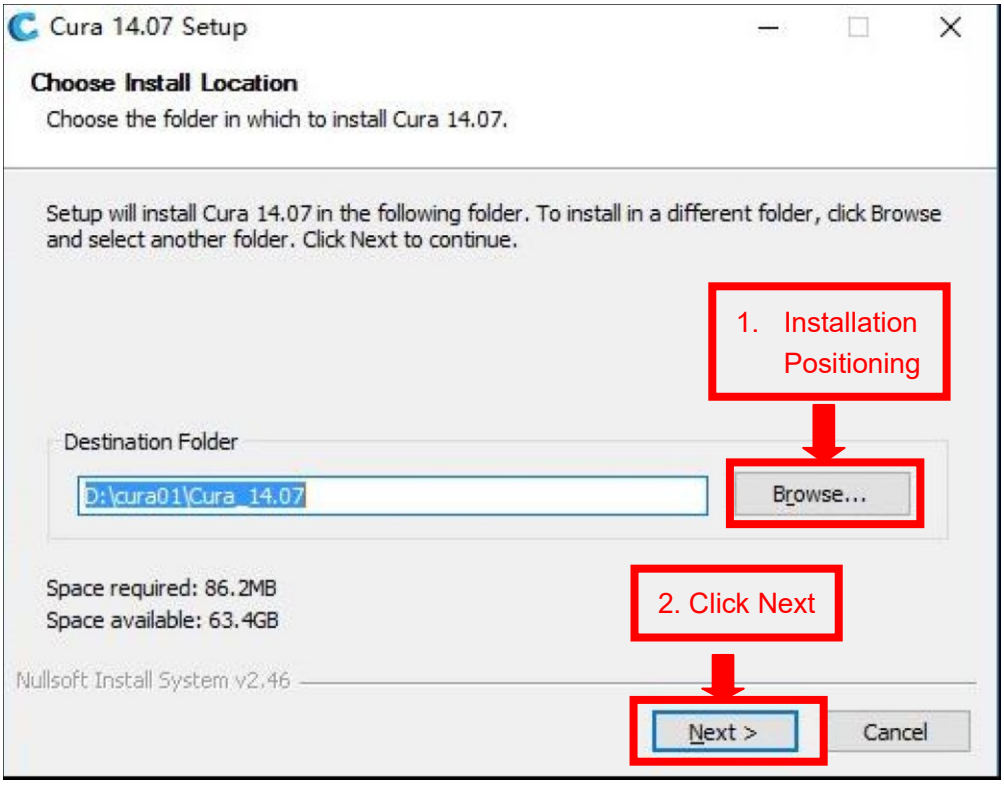


2) Download from Internet

Official Website：https://ultimaker.com/en/cura-software/list

Choose corresponding software to download

b.Software Installation Process



Cura 14.07 Setup
Choose Install Location
Choose the folder in which to install Cura 14.07.
Setup will install Cura 14.07 in the following folder. To install in a different folder, click Browse and select another folder. Click Next to continue.
1. Installation Positioning

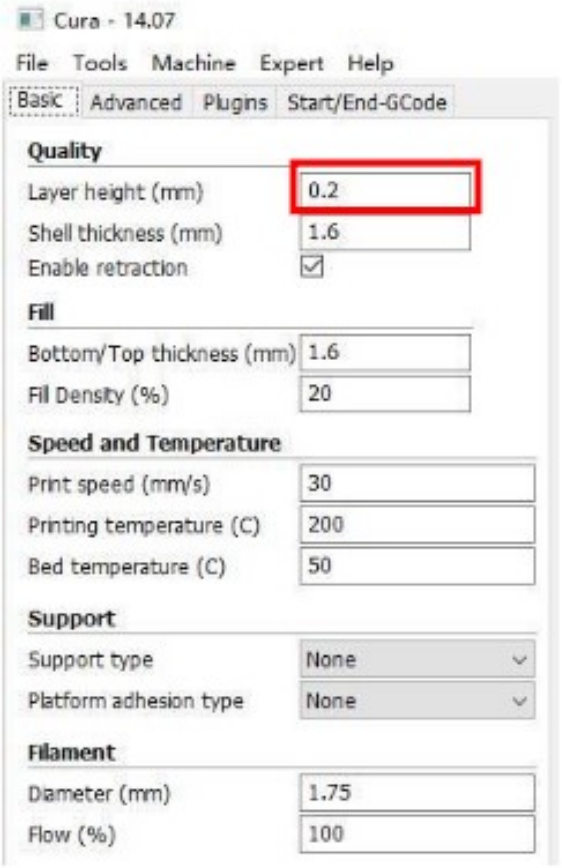
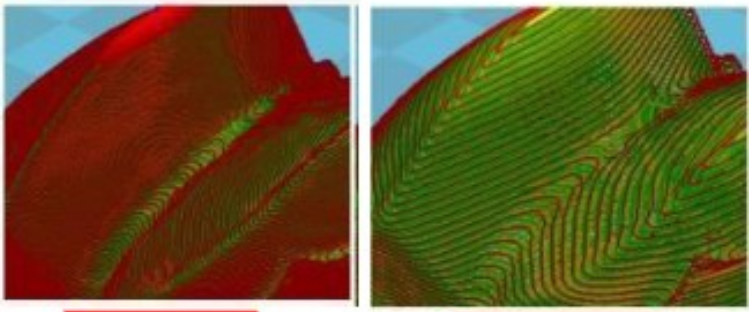
1 hour 53 minutes
4.93 meter 15 gram
If print once at a time , it will influence the printing quality, even cause damage to priner. So please choose “Printer at once”.

2.3 Layer height settings

Layer height： 0.1mm cost long time but have the best printing precision. 0.2mm cost half time compared to 0.1mm , but have general printing precision. 0.3 cost less time with not good precision. It defaults 0.2mm.

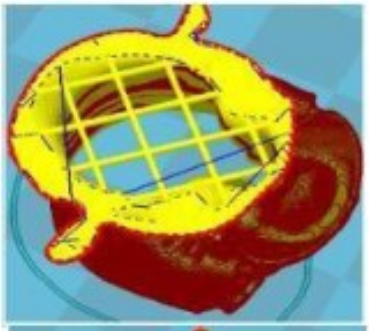




Left: 0.1mm Layer height

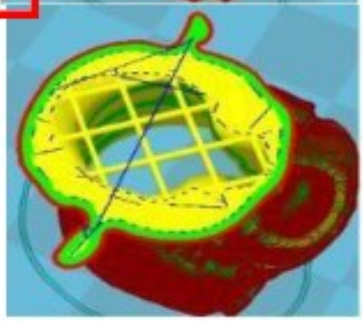
Right: 0.2mm Layer height

Layer height setting

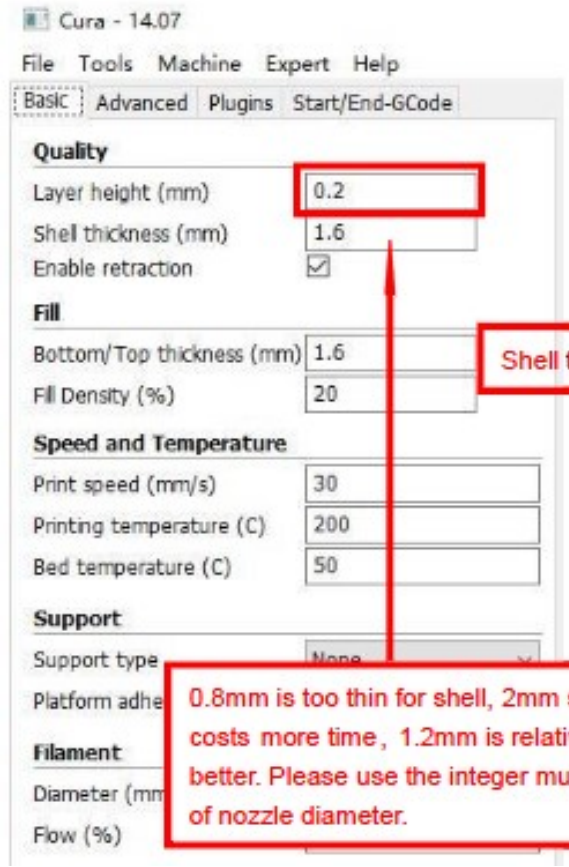


0.8mm

1.2mm

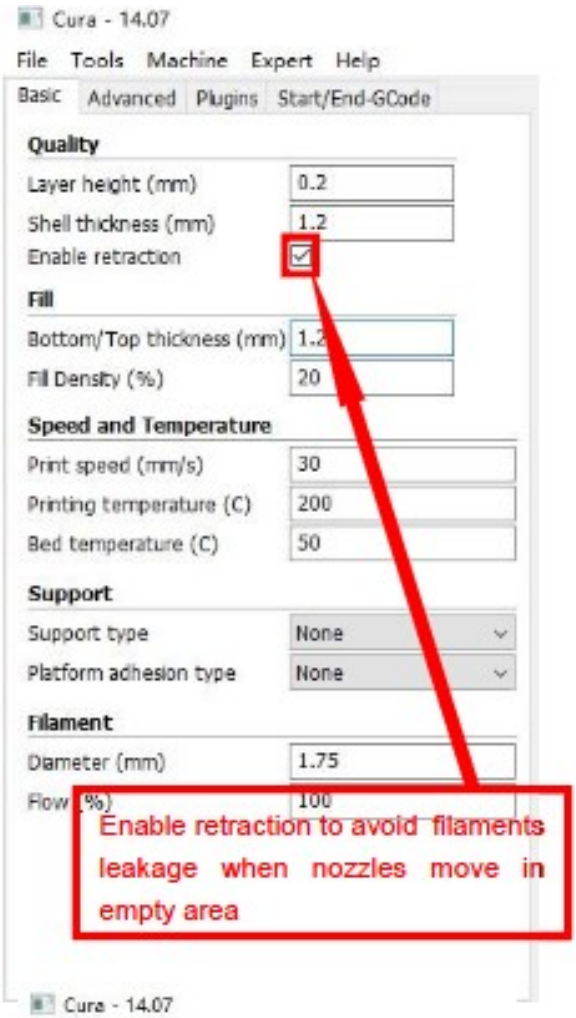


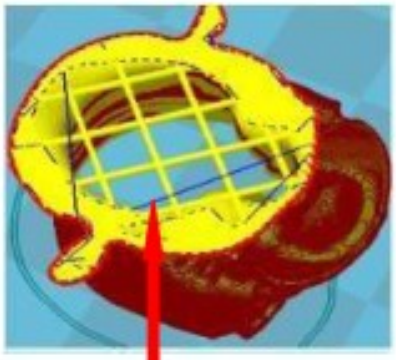
2mm



Shell thickness setting

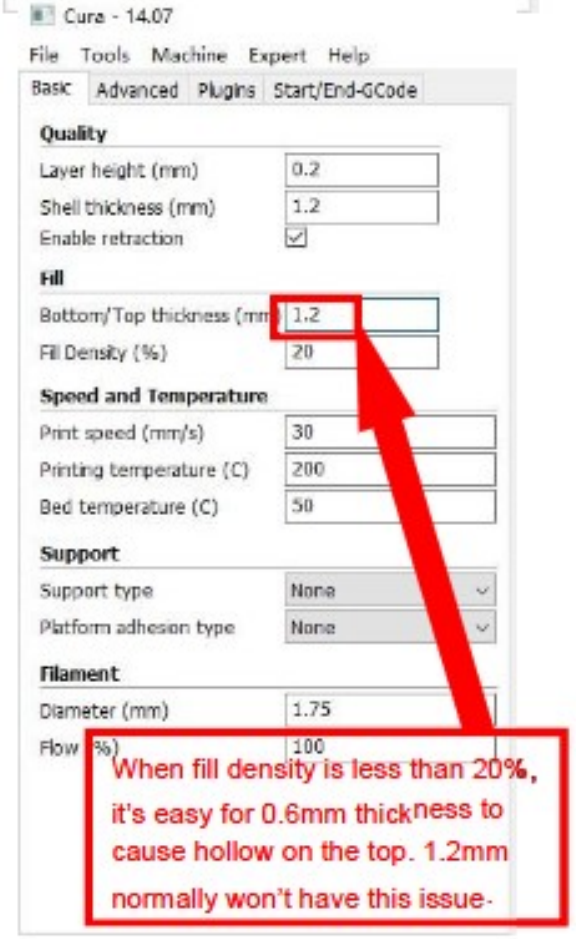
0.8mm is too thin for shell, 2mm shell costs more time, 1.2mm is relatively better. Please use the integer mutiple of nozzle diameter.

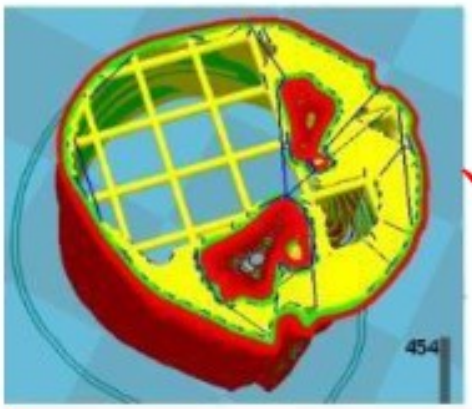




The Blue line is the leak filament

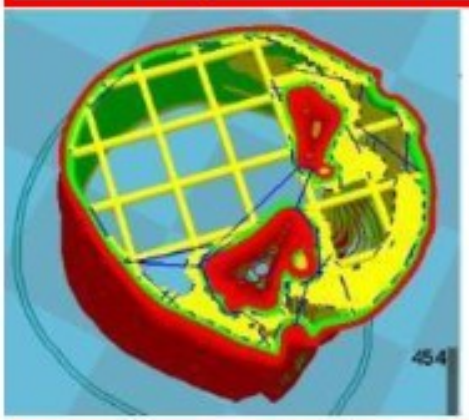
Enable retraction





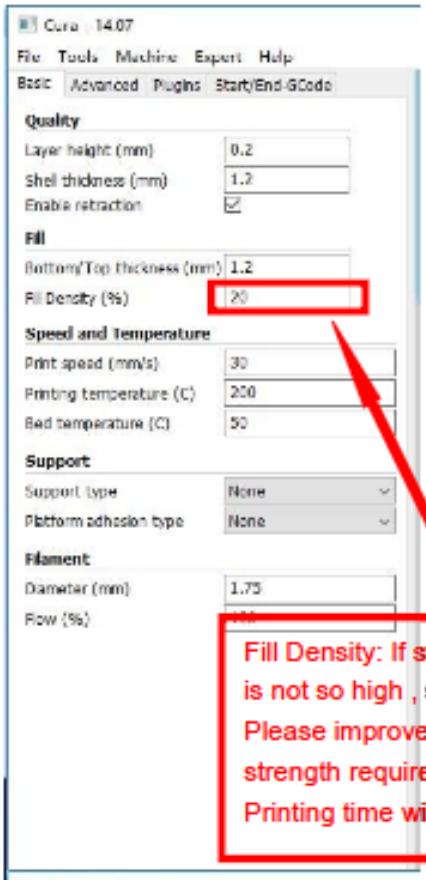
Bottom/Top thickness: 1.2mm

Under the same fill density

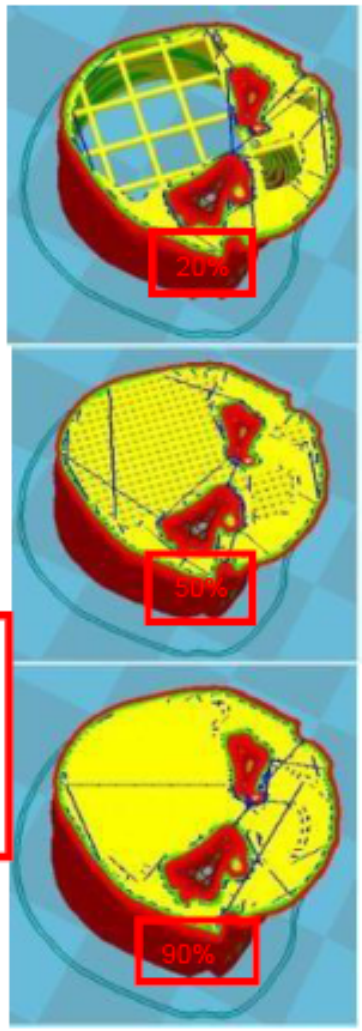


Bottom/Top thickness: 0.6mm

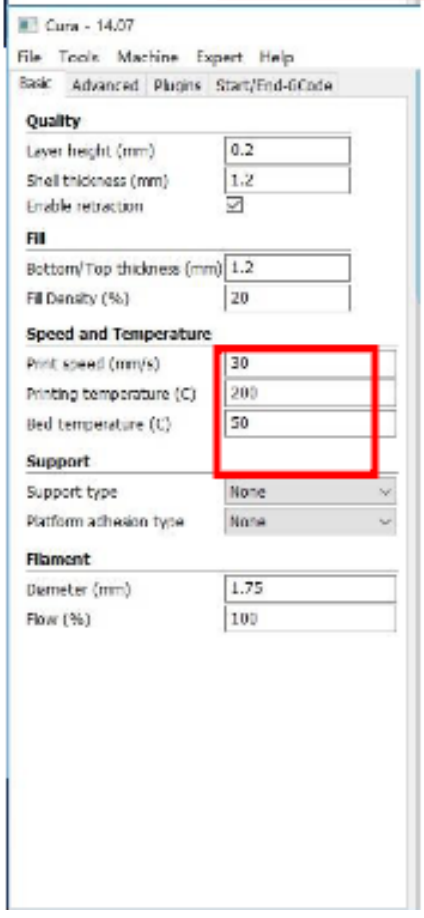
Bottom/Top thickness setting



Fill Density Setting



Fill Density: If strength requirement is not so high , set 10% is ok.
Please improve fill density when strength requirement gets higher.
Printing time will go up as well.



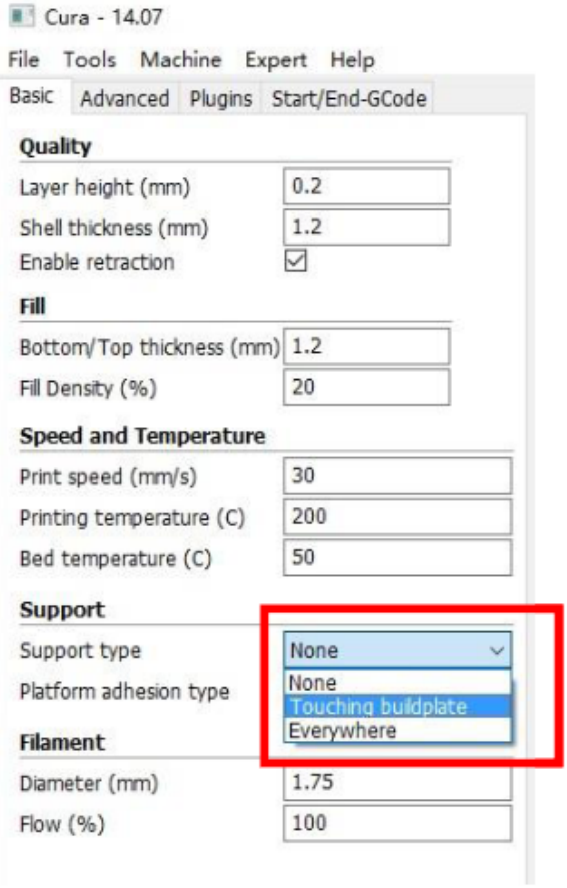
Printing Speed setting

This is default speed. If other settings aren't changed, it prints more accurately while the printing process takes more time.
High printing speed takes less time while it cannot print accurately , making the model have bad quality.
Normally 40-60 print speed is suitable for printing.

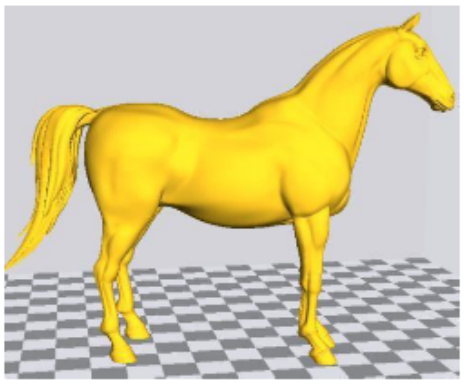
Pringting Temperature

PLA filament temperature setting: nozzle: 190-210 ℃ hotbed: 40-60℃

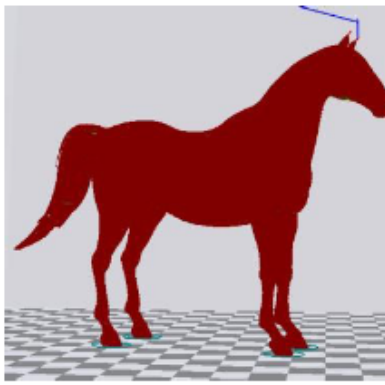
ABS filament temperature setting: nozzle: 230-250℃ hotbed: 60-90℃



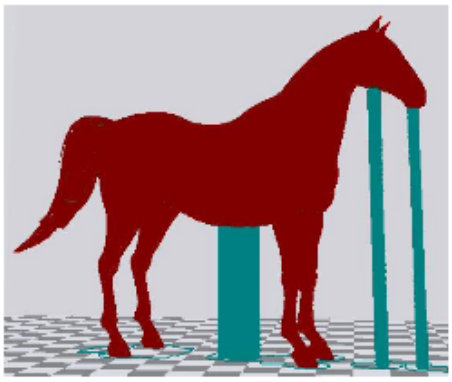
Support type setting



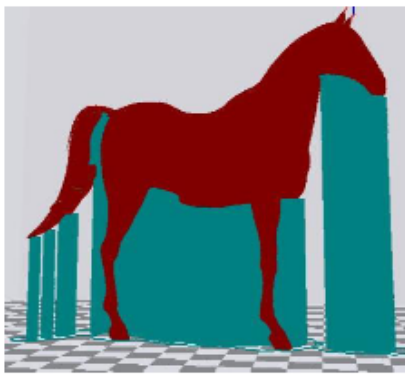
Original Model



Support type: None

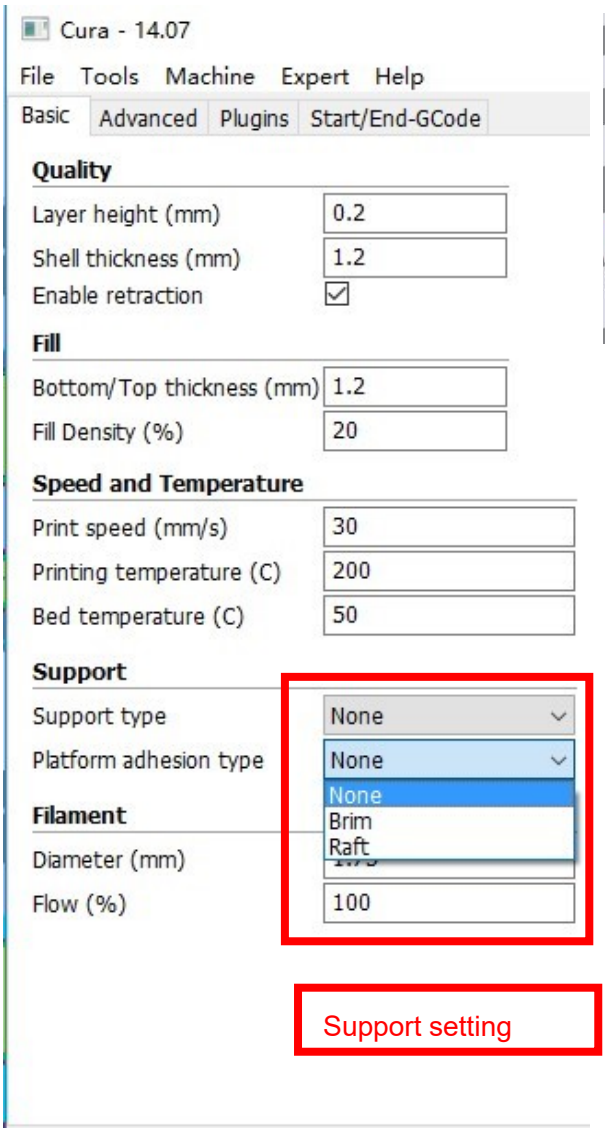


Support type: Touching

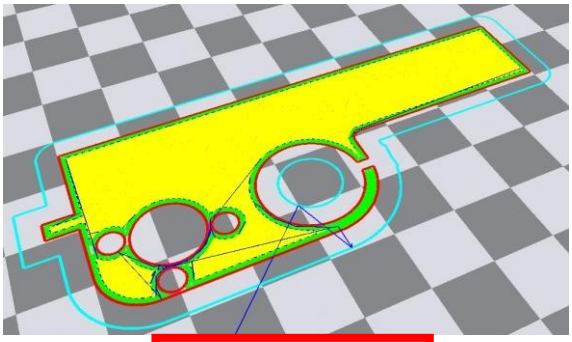


Support type: Everywhere

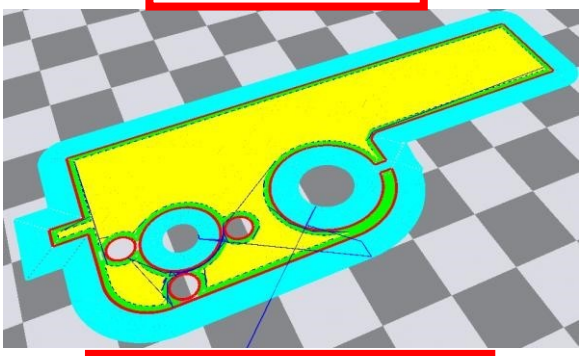
Attention: Normally we add support to complex model or model with vacant parts. It may have influence on the surface if you choose everywhere. You'd better circle around the model and try to avoid unnecessary support.



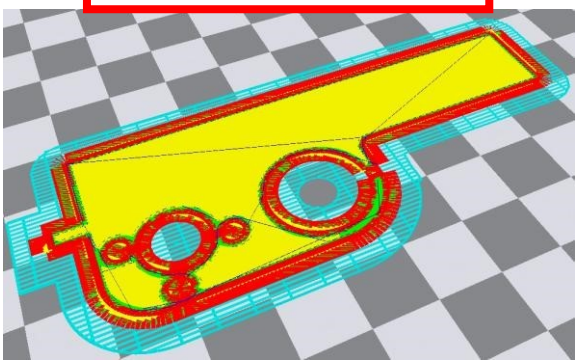
Support setting



None: no support

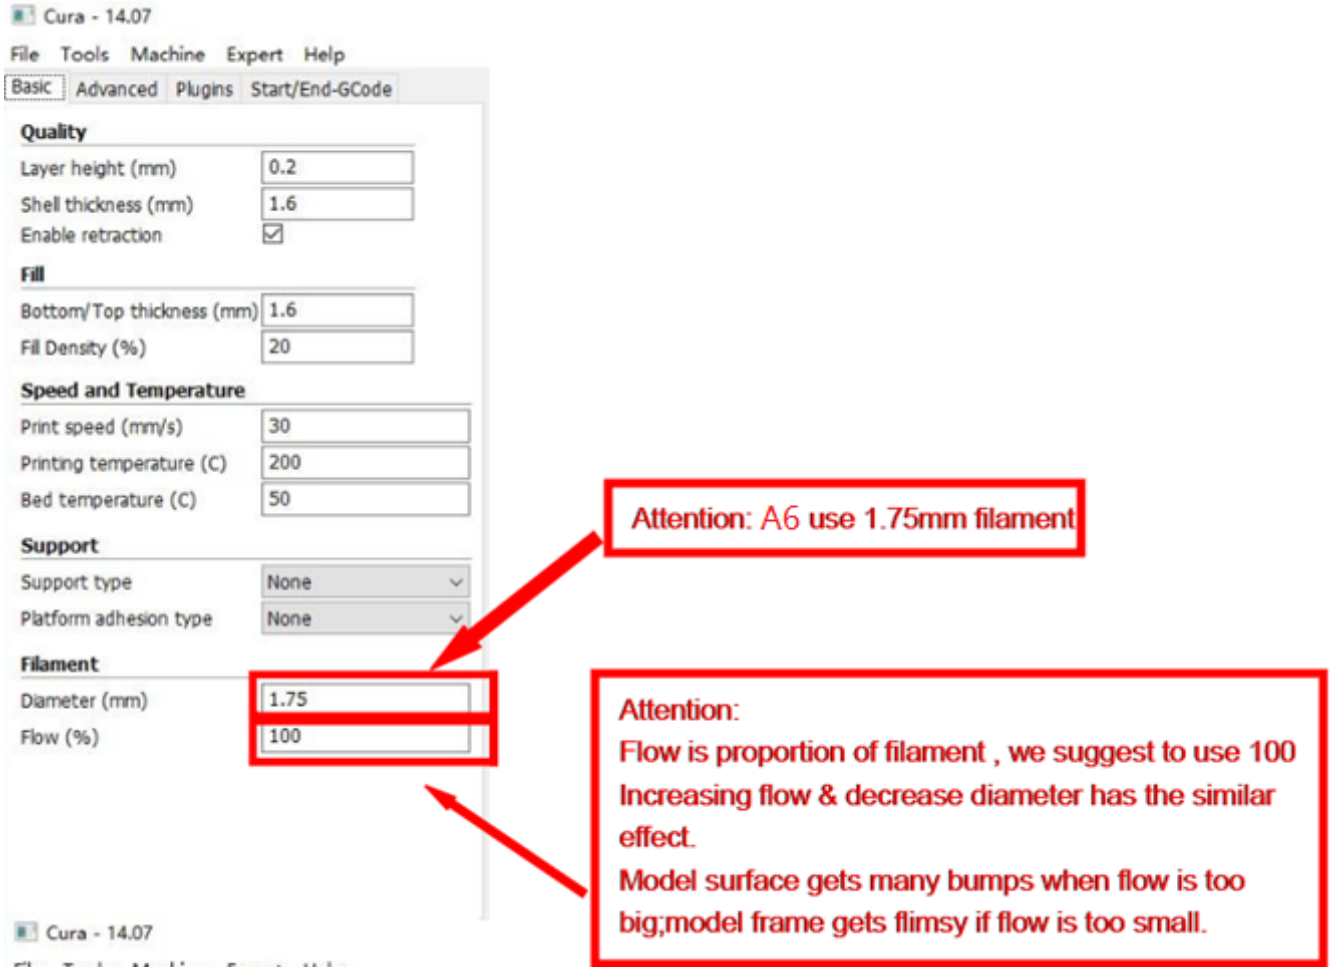


Brim:Touch with the adge



Raft: Totally touch with the bottom

Attention: please choose None if the printing platform is ready and the high temperature adhesive tape is good. Please choose Brim when the model is small . Choosing Raft makes it difficult to seperate model from the platform



Cura - 14.07
File Tools Machine Expert Help
Basic Advanced Plugins Start/End-GCode
Quality
Layer height (mm) 0.2
Shell thickness (mm) 1.6
Enable retraction
Fill
Bottom/Top thickness (mm) 1.6
Fill Density (%) 20

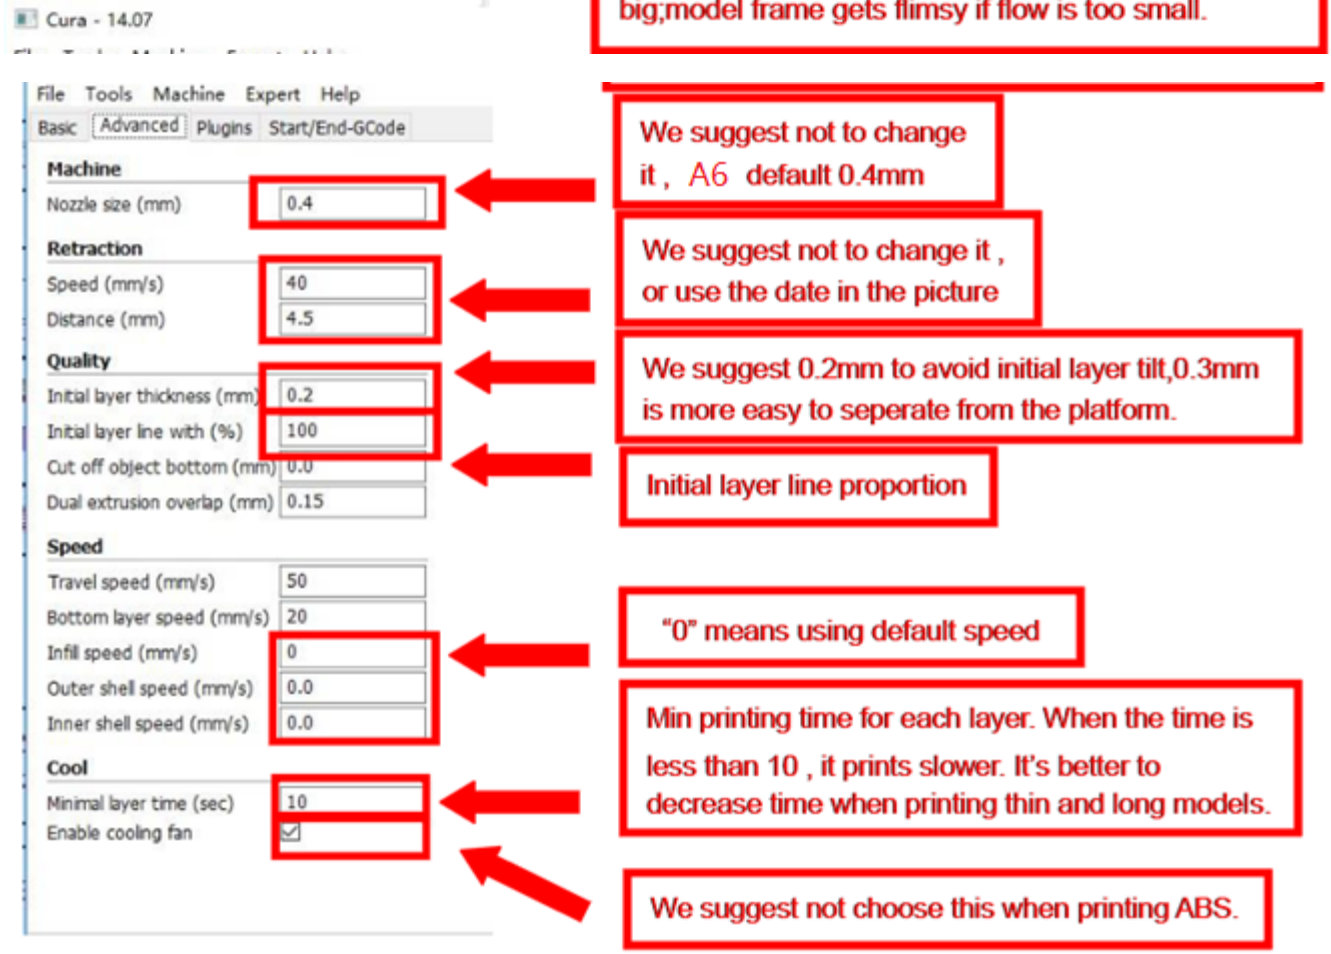
Print speed (mm/s) 30
Printing temperature (C) 200
Bed temperature (C) 50
Support
Support type None
Platform adhesion type None
Filament
Diameter (mm) 1.75
Flow (%) 100
Attention: A6 use 1.75mm filament
Attention:
Flow is proportion of filament , we suggest to use 100
Increasing flow & decrease diameter has the similar effect.
Model surface gets many bumps when flow is too big;model frame gets flimsy if flow is too small.



Cura - 14.07
File Tools Machine Expert Help
Basic Advanced Plugins Start/End-GCode
Machine
Nozzle size (mm) 0.4
Retraction
Speed (mm/s) 40
Distance (mm) 4.5
Quality
Initial layer thickness (mm) 0.2
Initial layer line with (%) 100
Cut off object bottom (mm) 0.0
Dual extrusion overlap (mm) 0.15

Travel speed (mm/s) 50
Bottom layer speed (mm/s) 20
Infill speed (mm/s) 0
Outer shell speed (mm/s) 0.0
Inner shell speed (mm/s) 0.0
Cool
Minimal layer time (sec) 10
Enable cooling fan
We suggest not to change it , A6 default 0.4mm
We suggest not to change it , or use the date in the picture
We suggest 0.2mm to avoid initial layer tilt,0.3mm is more easy to seperate from the platform.
Initial layer line proportion
"0" means using default speed
Min printing time for each layer. When the time is less than 10 , it prints slower. It's better to decrease time when printing thin and long models.
We suggest not choose this when printing ABS.

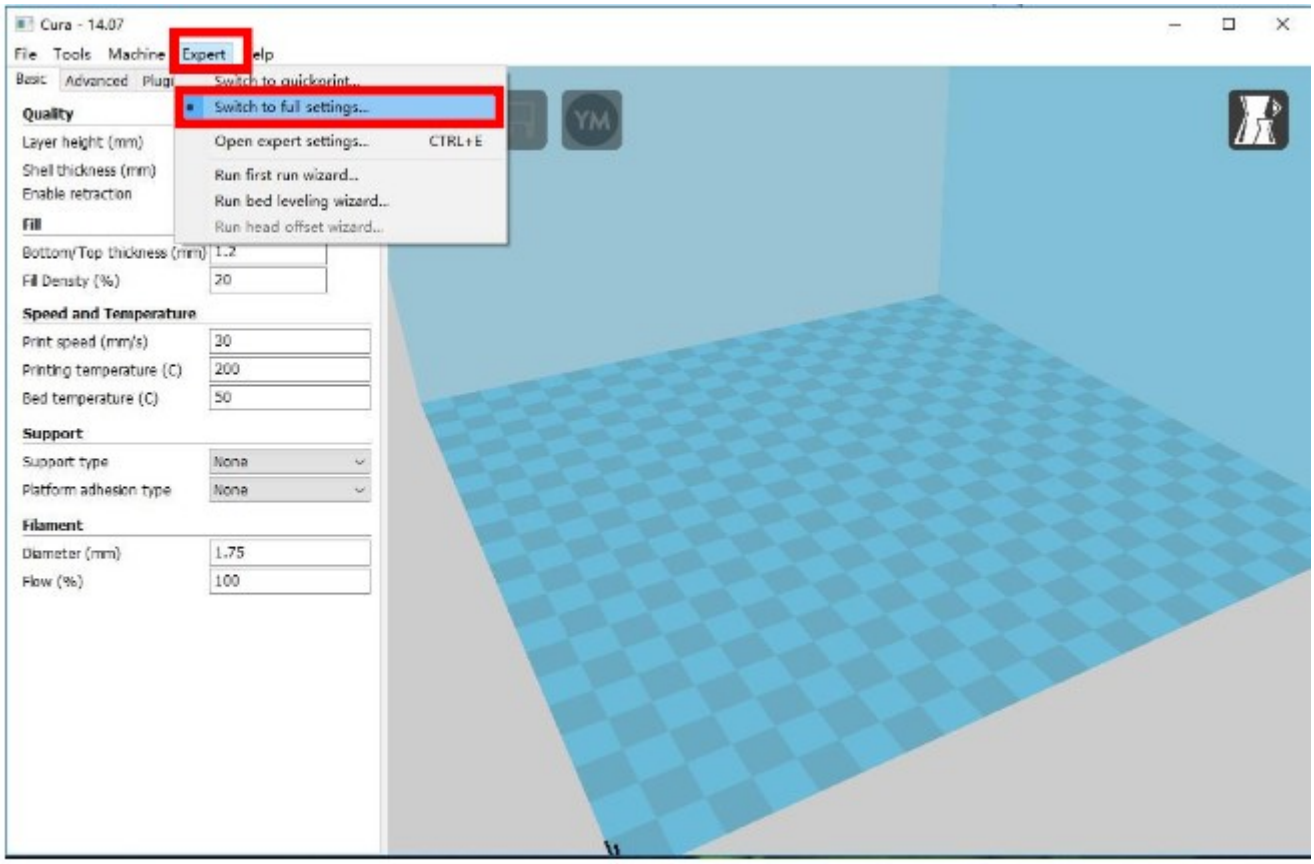
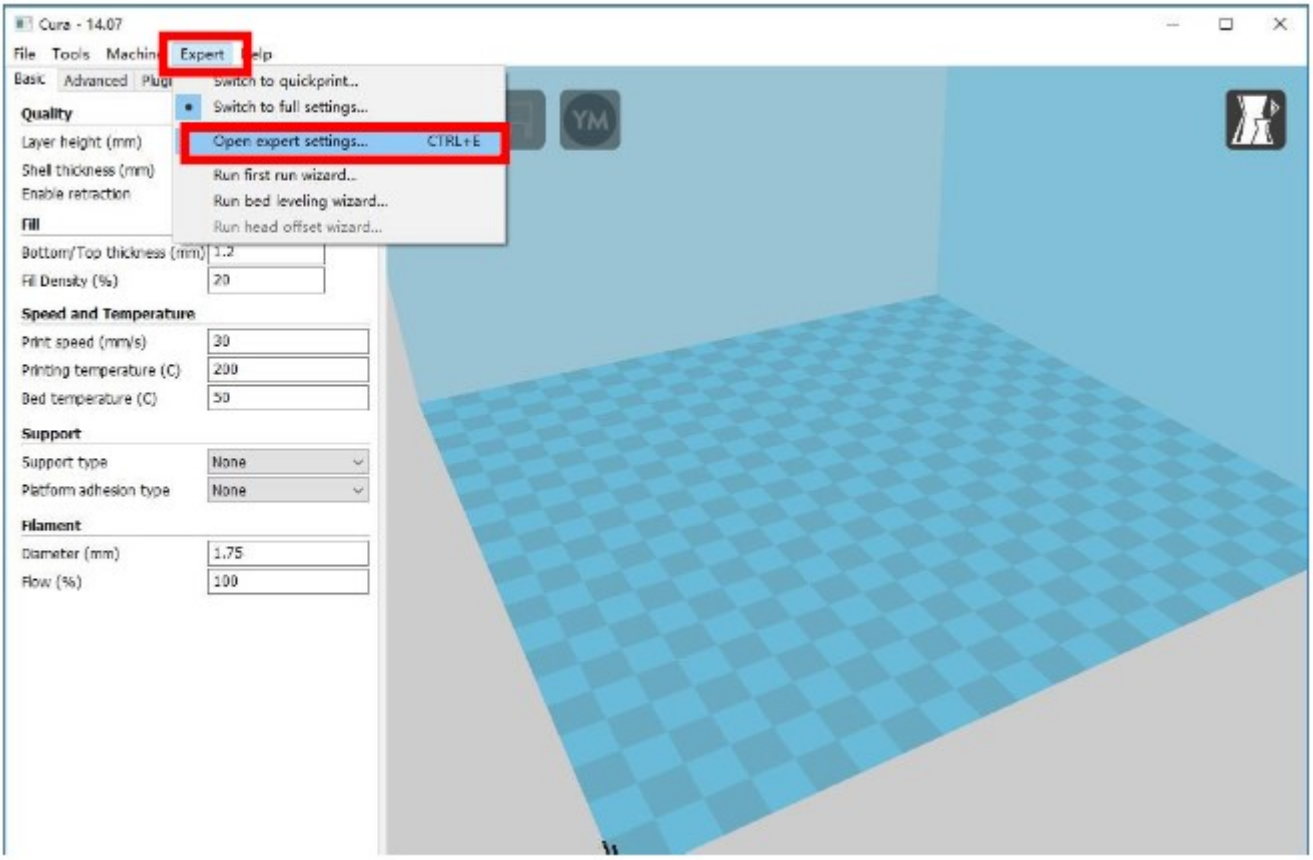
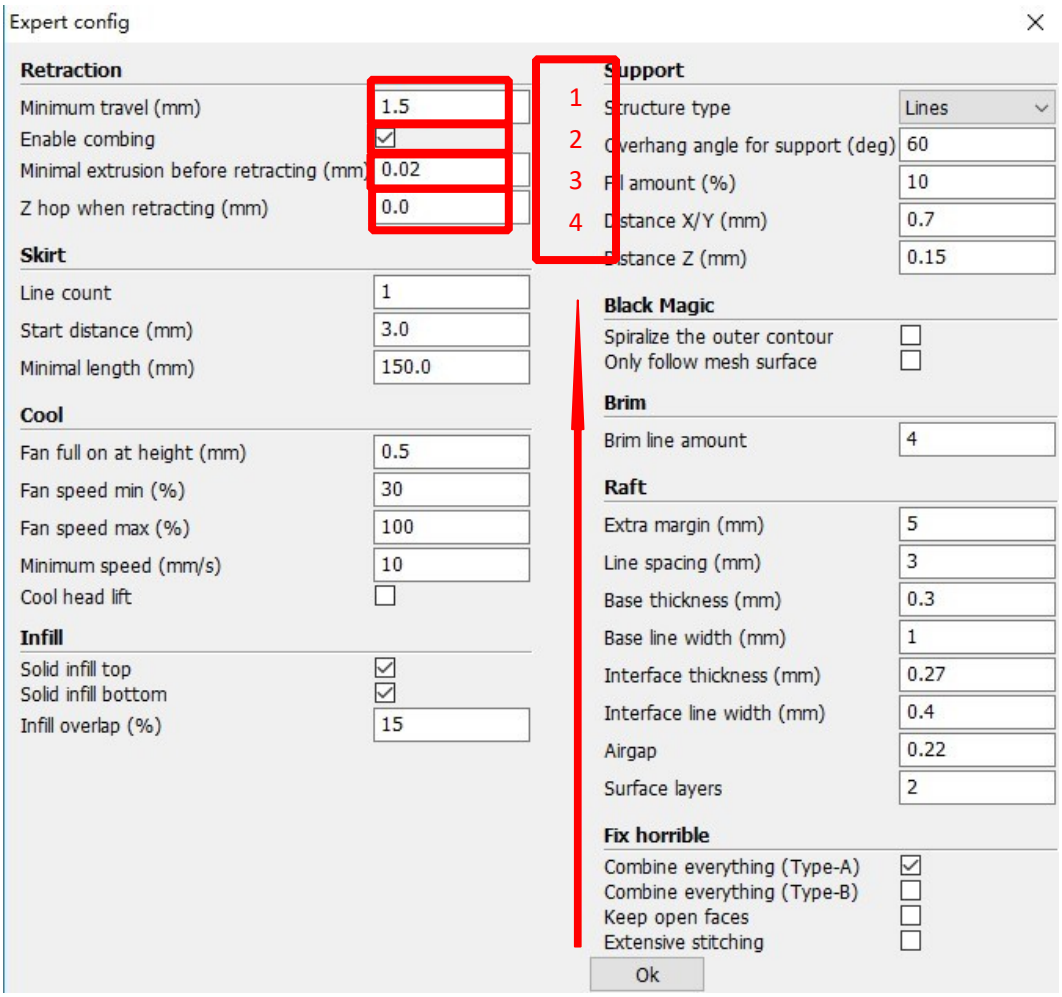
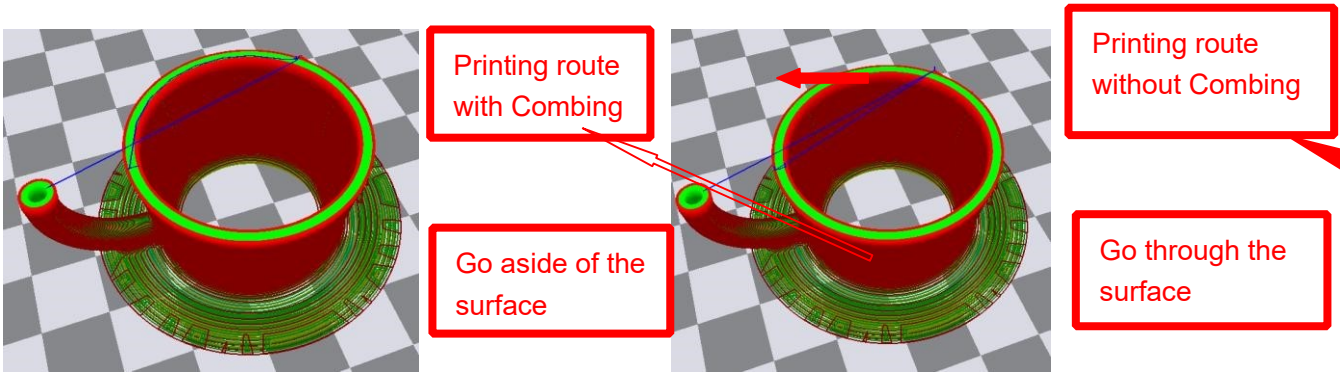
3.Expert Setting

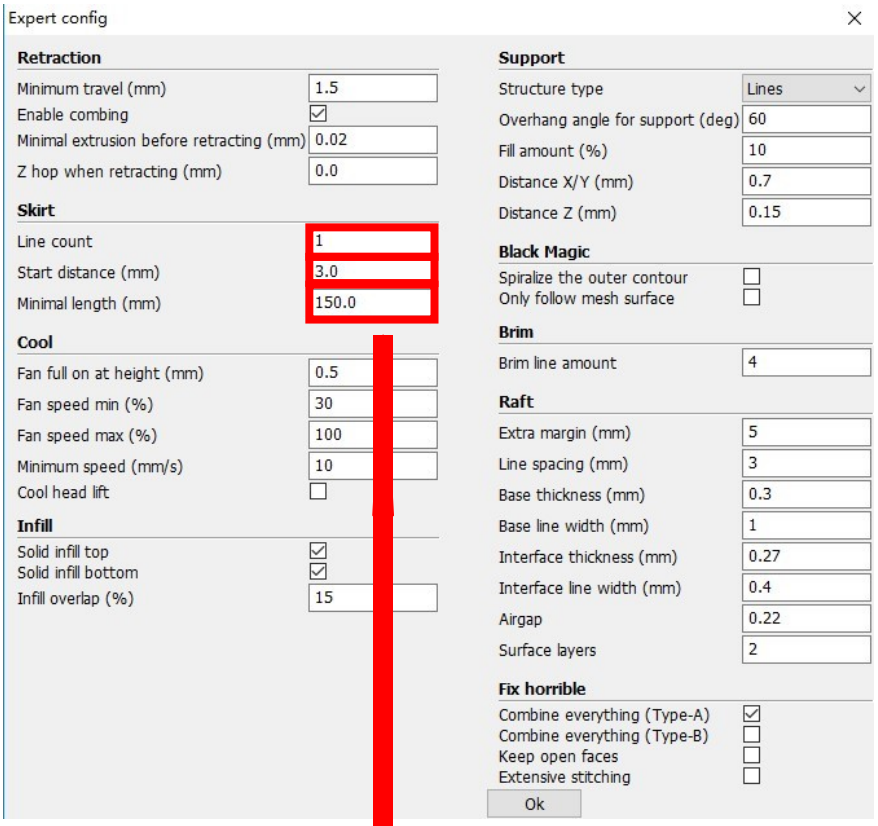




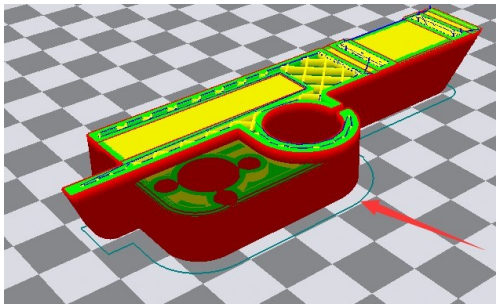


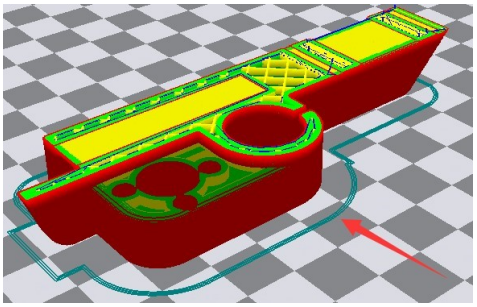
1. The minimum length before retraction . Used to avoid frequent retraction. No need to change.
2. Enable Combing: Digital for surface quality , the nozzle will try not to go through surface , that's why Cura is better than Slic3r.
3. Minimum extrusion length , to avoid frequent extrusion.
4. The height extruder rise in the retraction . If you need to set this option , 2mm is suitable .





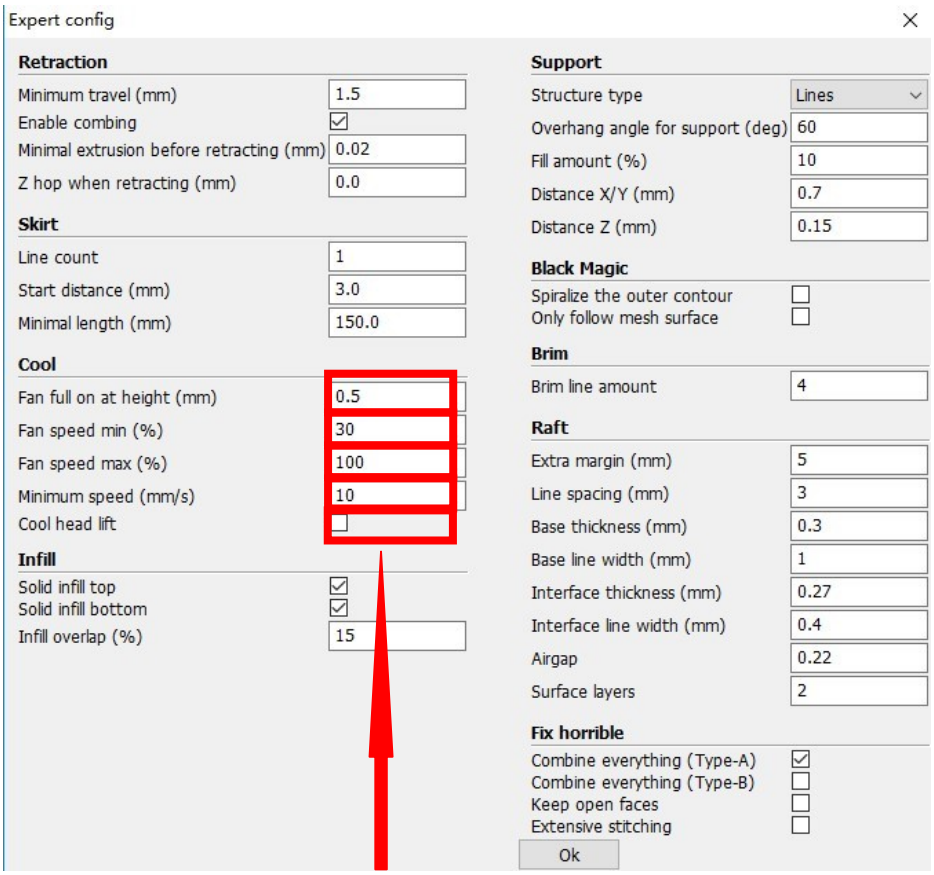
Skirt is to avoid extruder unfilled before printing , and it appears only when platform attachment type is None. Normally “1” is ok . Change it to “0” when your model reaches the maximum size , or the printing size will be too big.





Peripheral line quantity: 1
Start distance: 3

Peripheral line quantity: 1
Start distance: 3



1. To ensure the attachment of model to platform , fan won't start at the beginning.

2-4. Fan speed min & max : If they are not equal , the soft ware will choose a suitable speed during them.

5. Condition to choose cool head lift : When it's printing with the minimum speed but still cannot reach the minimum time , you need to choose cool head lift . But it may cause filament leak.

Expert config

Retraction

Minimum travel (mm)	1.5

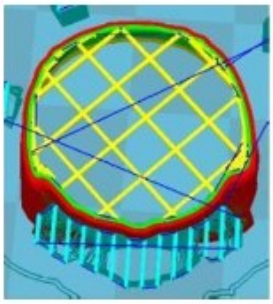
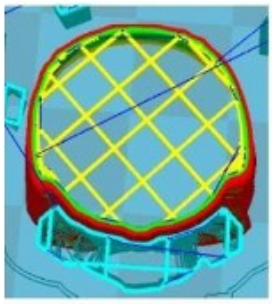
Infill covertap: 15
Distance X/Y: 0.7

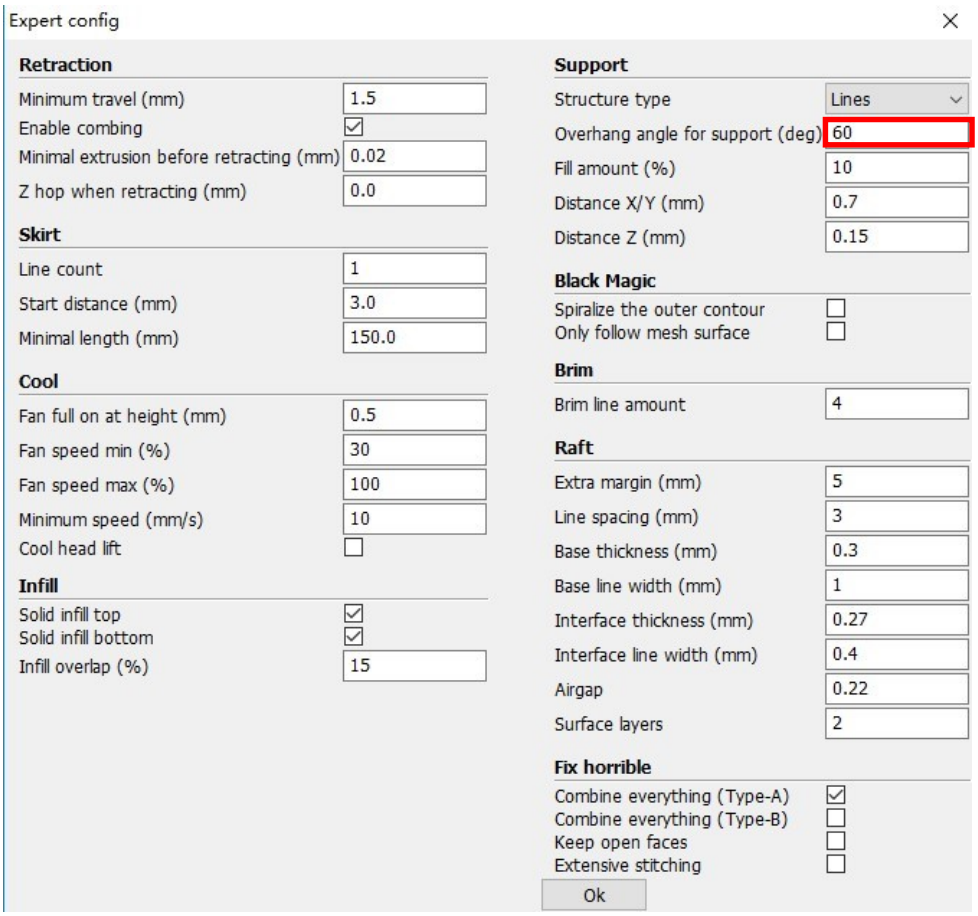


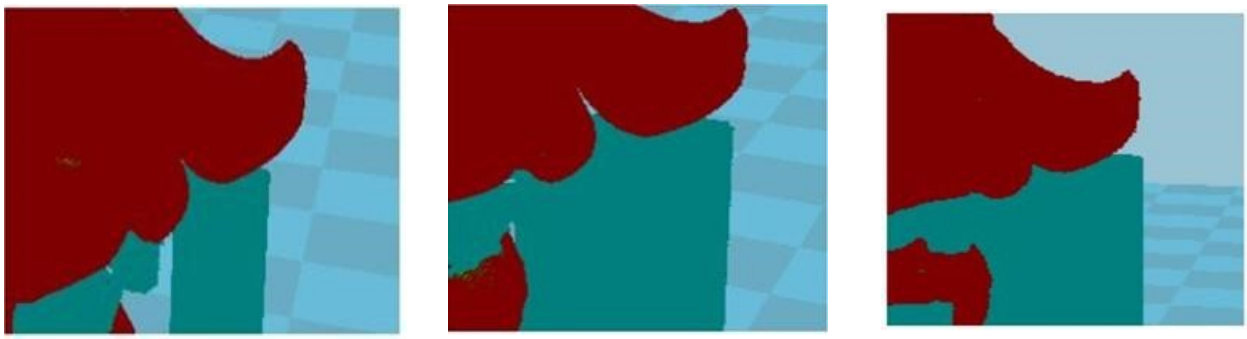
Structure types:lines
Infill covertap: 30
Distance X/Y: 0.7



Structure types:grids
Infill covertap: 15
Distance X/Y: 0.7

These above are examples , you can set these options according to actual requirements. The biggest progress Cura has made is the kinds of support structure types , making it easier to seperate from the model.





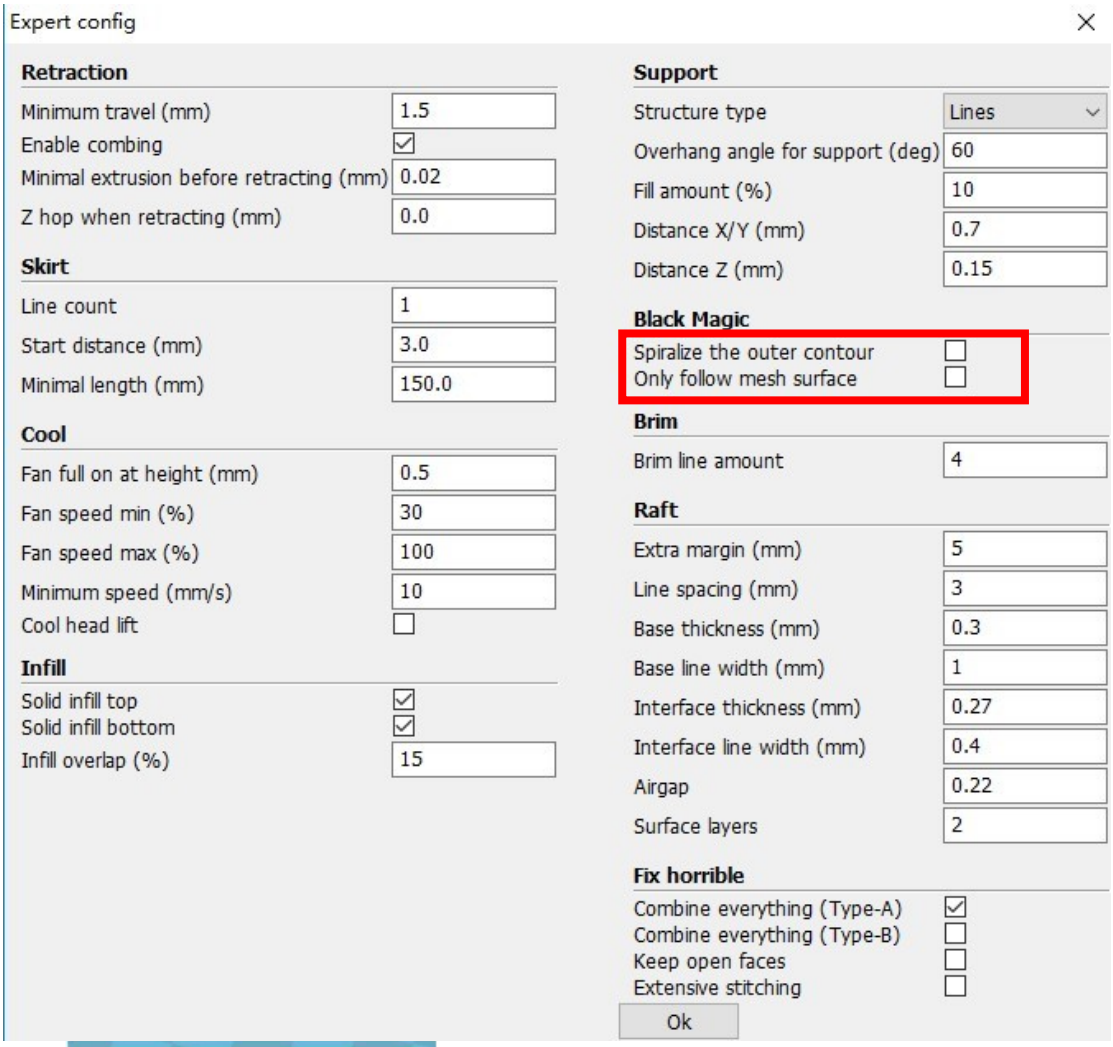
60°

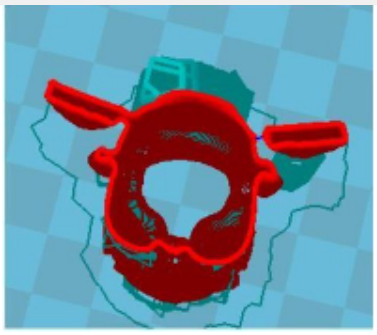
45°

30°

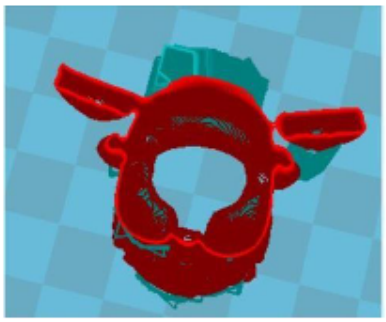
It's difficult to seperate if the distance between support and the supported place is too close; The surface will be influenced if the distance is too far.

Different angle will generate different support , you can try the examples we provide above which will have different effect.





When choosing "Spiralize the outer contour" : Z axis rises while X,Y axis moves , and only a hollow bottom and a single layer of surface.



When choosing "Only follow mesh surface" : The nozzle prints along the surface.

Attention: The software defaults not open the option above , you'd better not turnit on .

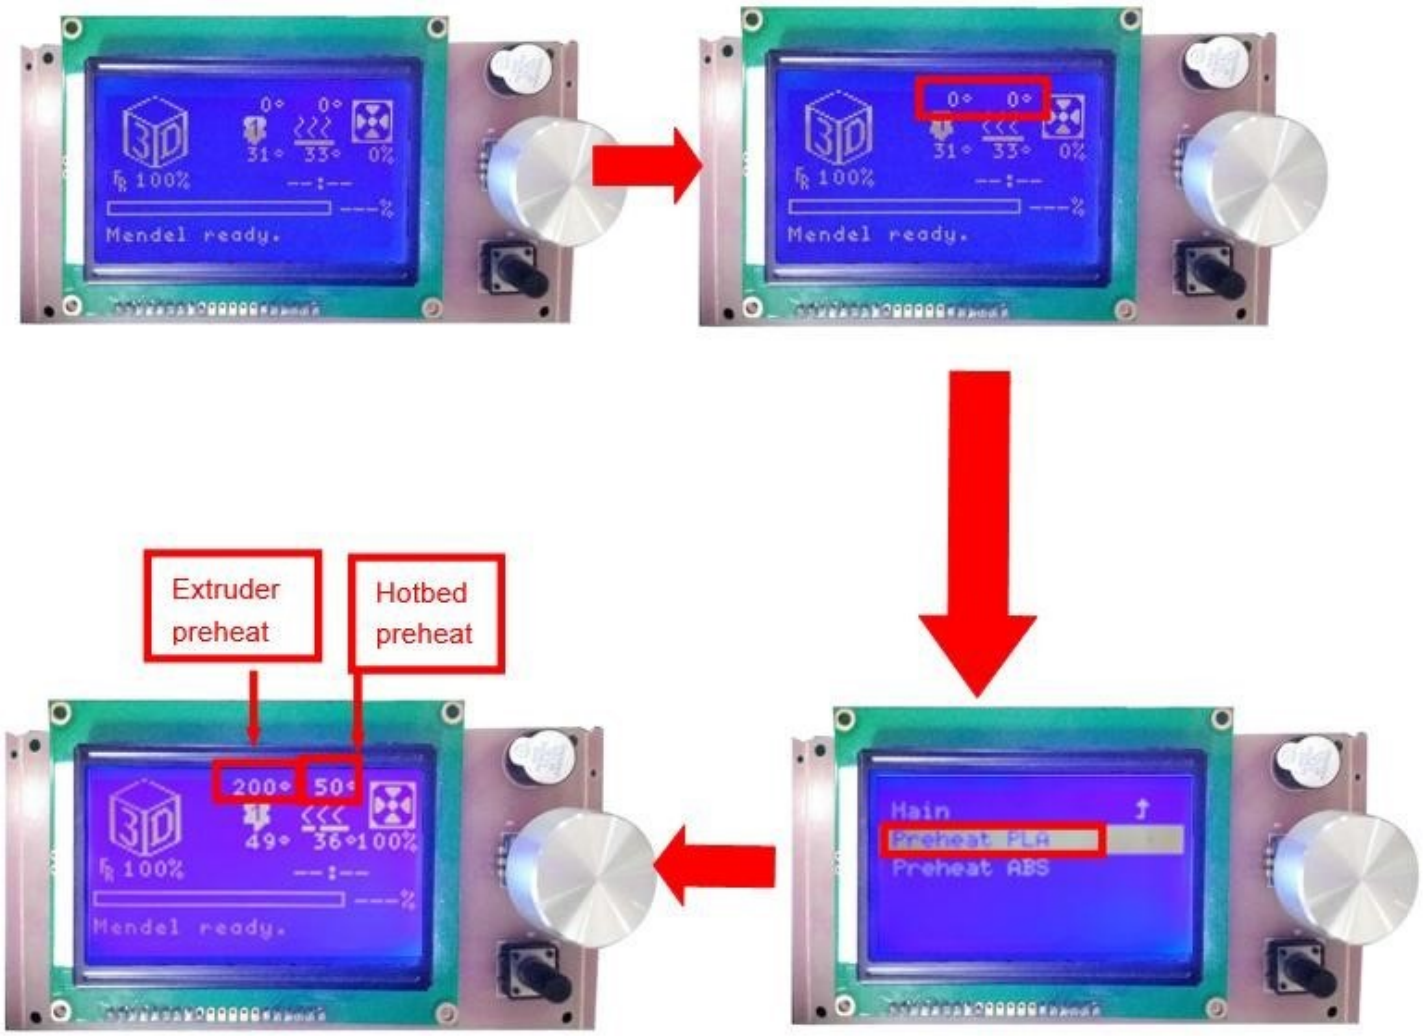
2.Filament Feeding

2.1 Set Preheat

Attention: Before filament installation, we need to preheat. Use PLA as example .

Press Knobs → Prepare → Preheat PAL → Start preheating

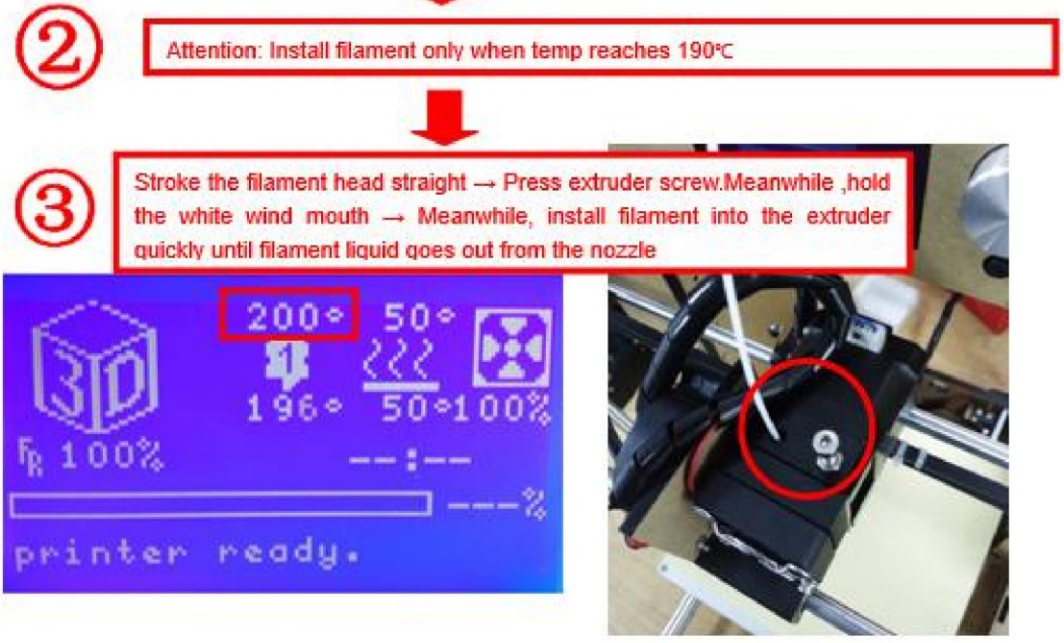


Attention: Please choose "Preheat ABS" if you want to print with ABS

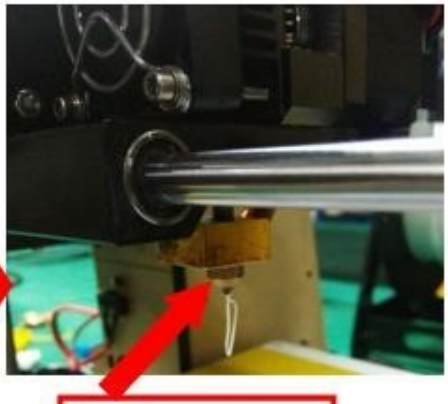
2.2 Filament Installation

Attention: only when extruder temp reaches 200℃ can we put filament in the printer.

Confirm Extruder Temp has reached 190℃ → 1 roll PLA → Stroke the filament head straight → Press extruder screw.Meanwhile ,hold the white wind mouth → Meanwhile, stick filament into the extruder quickly until filament goes out from the nozzle → Filament installation succeed



Press extruder screw, hold on wind mouth. Stick filament in quickly until filament goes out from extruder.



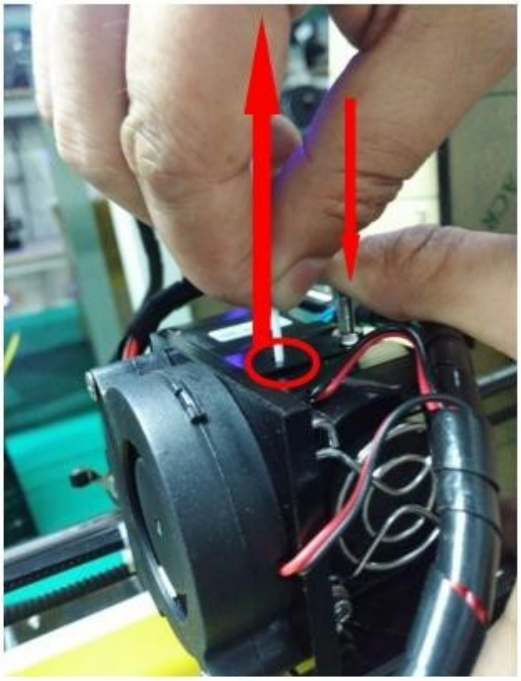
Attention:High temp!!

If the shape of output filament is average , means installation is good.

Filament installation succeed

2.3 Pull out filament

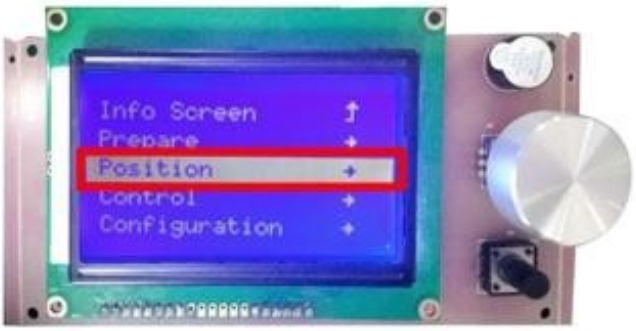
When Change filament/Long-term not in use of printer , you need to pull out filament.



Use PLA as example
1. Preheat extruder to 190℃
2. Press extruder screw, hold wind mouth. Meanwhile, stick filament down for a few length, then pull out with average speed.

Precautions:
1. Do not stick down for long length in order to avoid failure of pulling out. Replace filament timely.
2. Please confirm you have preheated the extruder to 190℃. Do not pull out before 190℃， or it will cause irreparable damage.

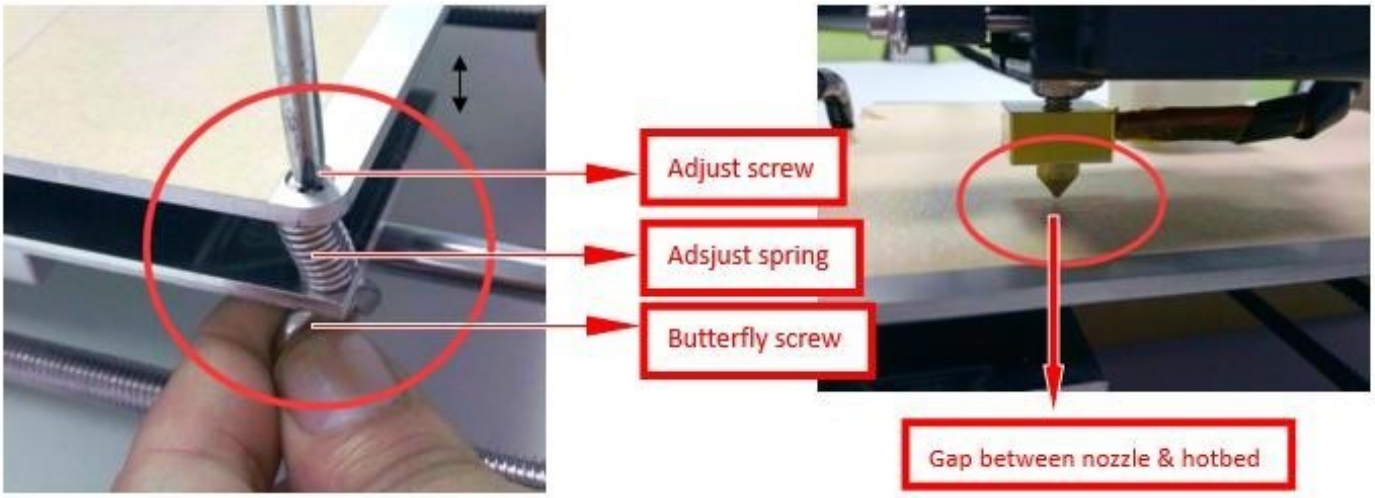
3.Platform Adjustment



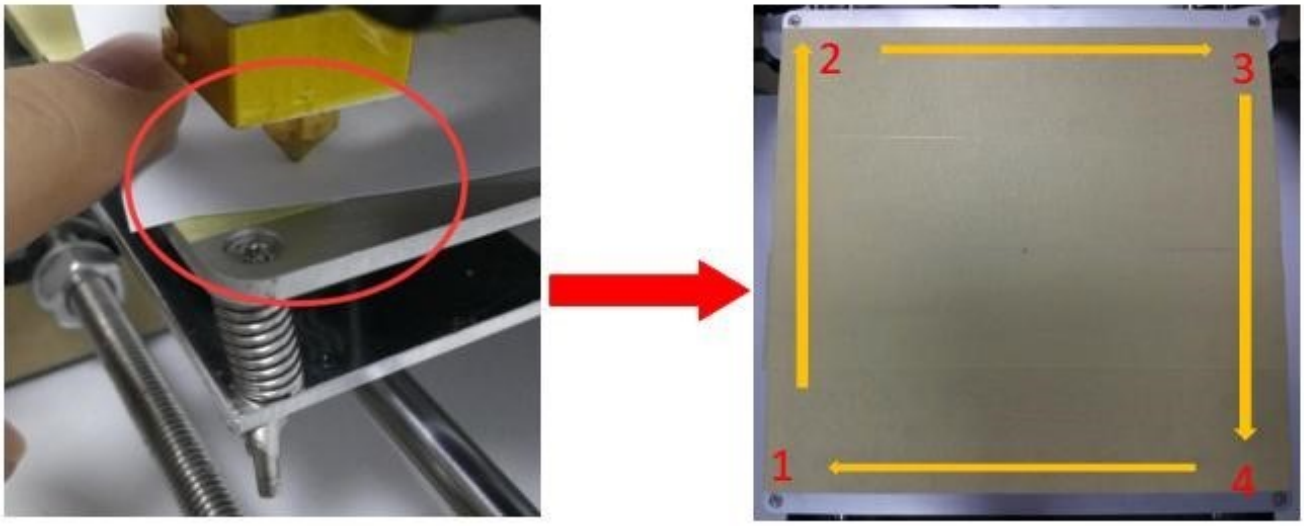
1. Choose “Position” → “Auto home” , printer will move to limited switch until it stops.

2. Turn off stepper motor: based on step 1 , enter “Quick settings” → “Disable stepper”

3. Please manually move nozzle to platform and check the gap between nozzle and platform.



4. When the gap is more than 2mm, you need to adjust the height of Z limited switch.
Example: When the gap is 12mm , you need to adjust limited switch down by 10mm.The rest 2mm can adjust by spring on the hotbed.



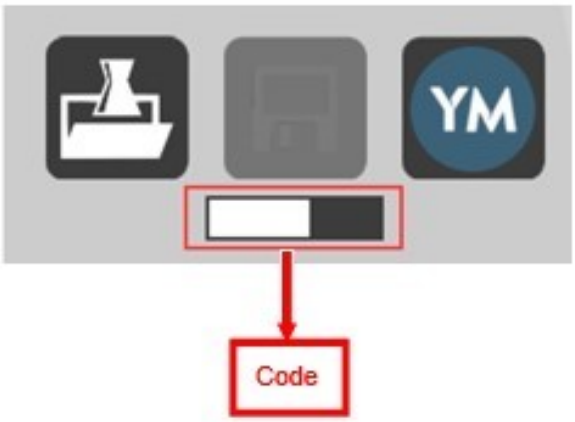
After adjustment of springs, reset printer and close stepper motor to test. Use A4 paper to test the gap.
Tips: When you are familiar with the printer with time going by, we can adjust while it's printing. It's because the printing speed is slow at the beginning so that there's enough time for adjustment. Meanwhile, the printing effect will be better.

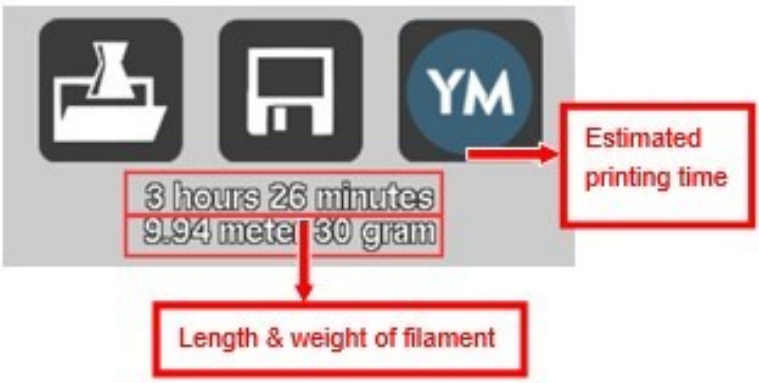
4.Printing

1) TF Card Offline Printing

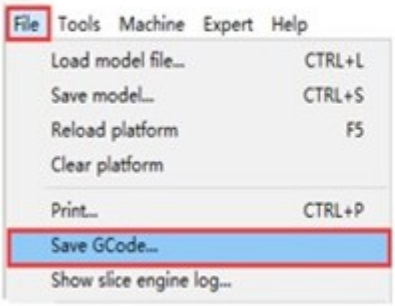
a. Loading mode

Cura supports STL file & G-code file.

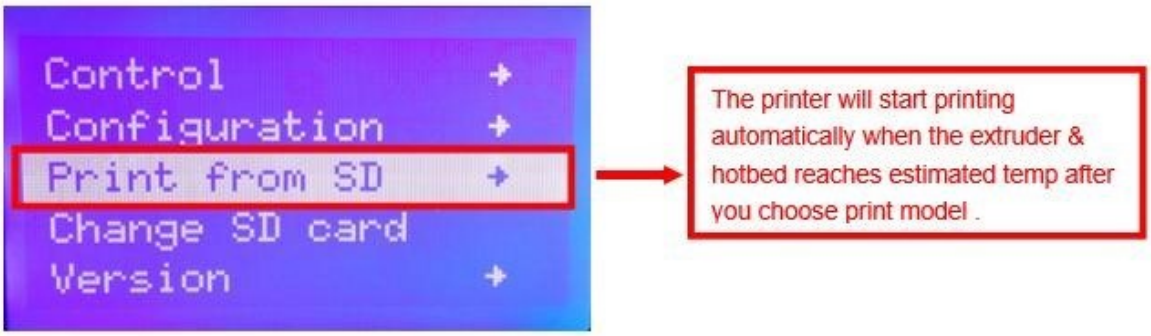




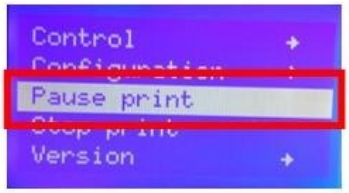
b. Code Saving



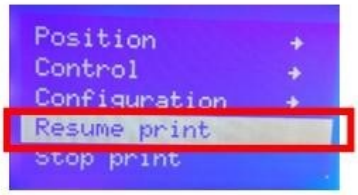
Copy file to TF card . Then connect TF card to printer, click reset. Picture below shows the location of print file , there are 2 methods to find print file.



c. Introduction of Stop print , Pause print , Continue Print:
Only when the printer is printing can we use Stop print, Pause print, Continue Print.

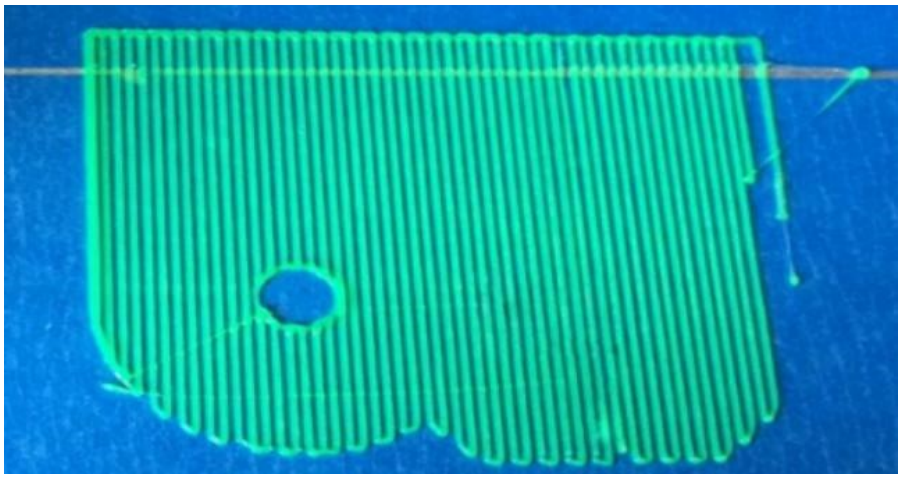


Attention:Please use the function according to your requirment .

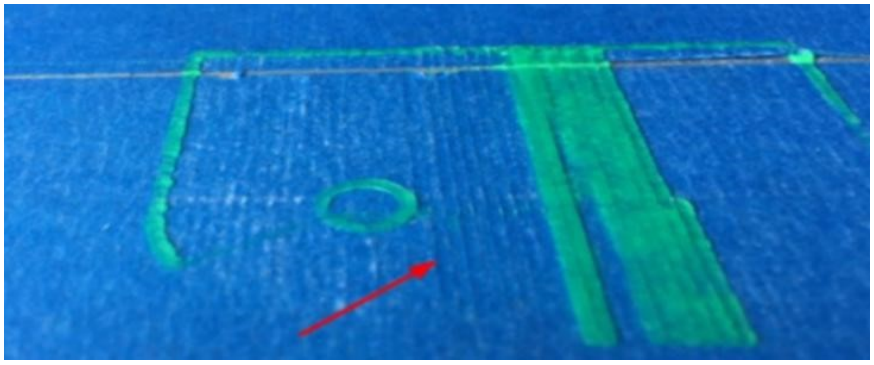


d.Judgment of the gap between nozzle and platform.

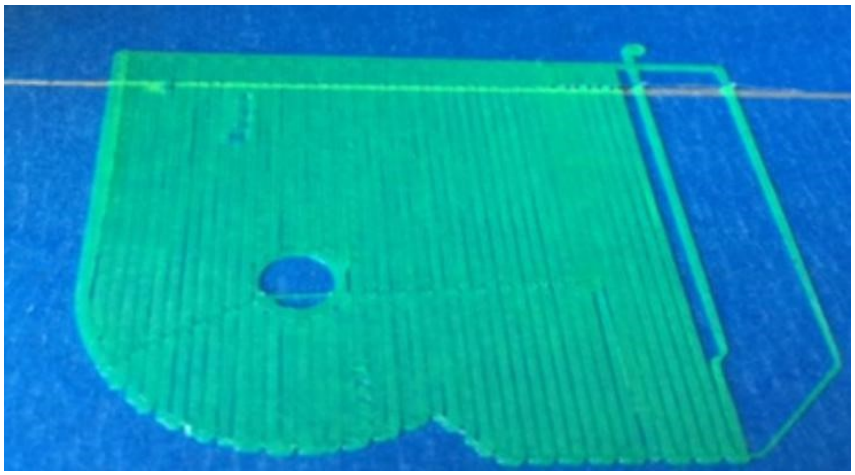
1. Too big gap: The printed model is uneven, curled with gap. It means the gap is too big for filament to reach the platform, making the printing effect so bad.



2. Too close gap: The printed model edge has irregular projections. It means the gap is too close to print normally. Sometimes it even cannot output filament



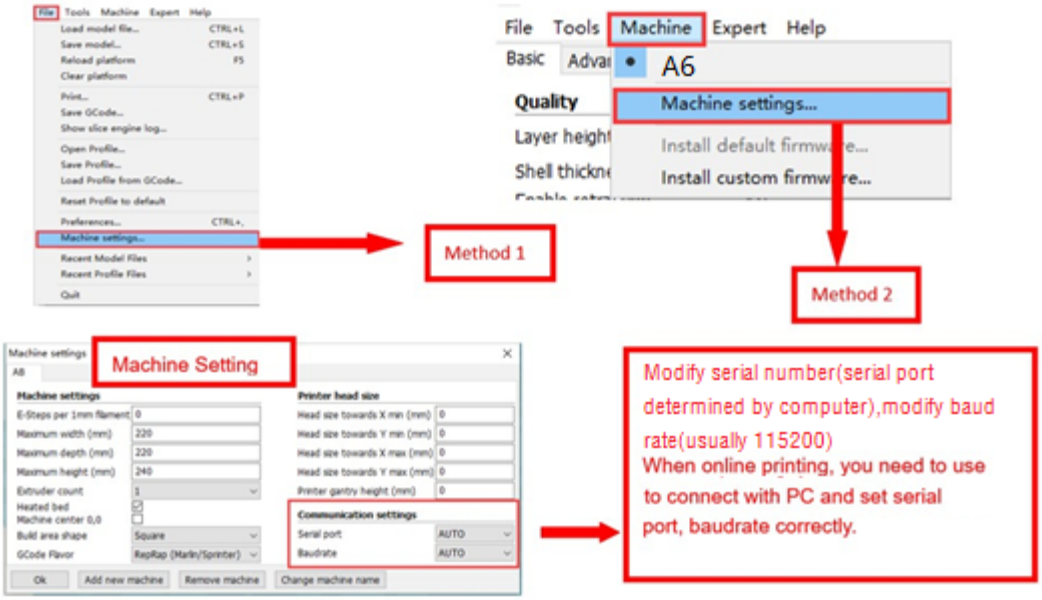
3. Appropriate distance: Printed model flat with no gap, no glitches. It means the distance is appropriate to print



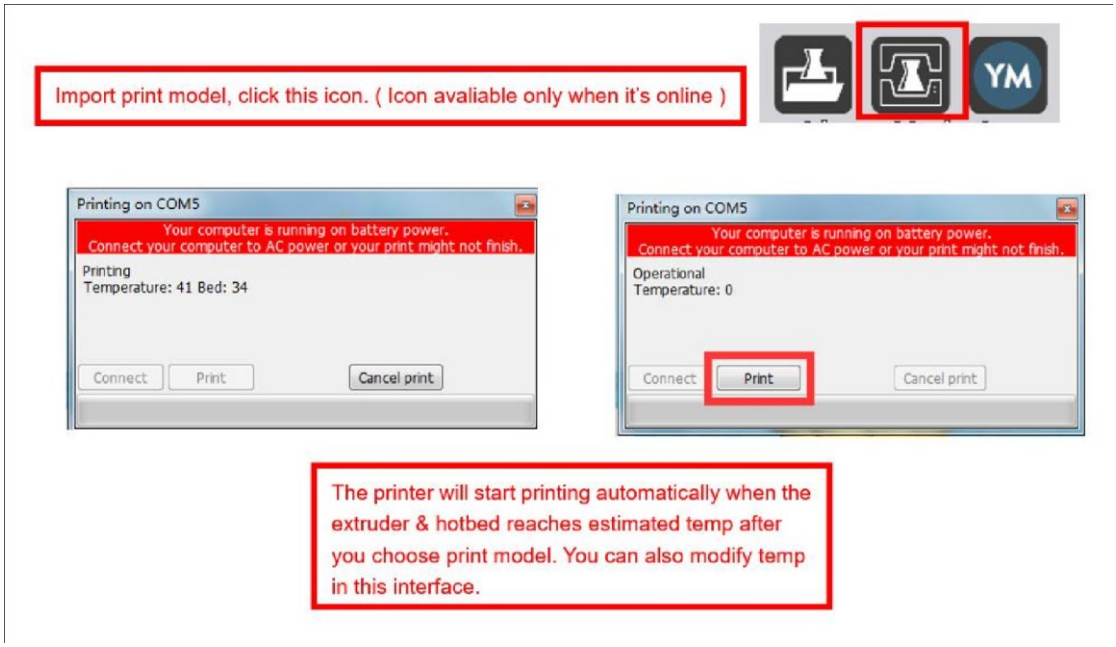
Wait to print complete after gap adjustment.

2) Online Printing

a. Machine settings (Use to connect to PC)



b. Online Pringting

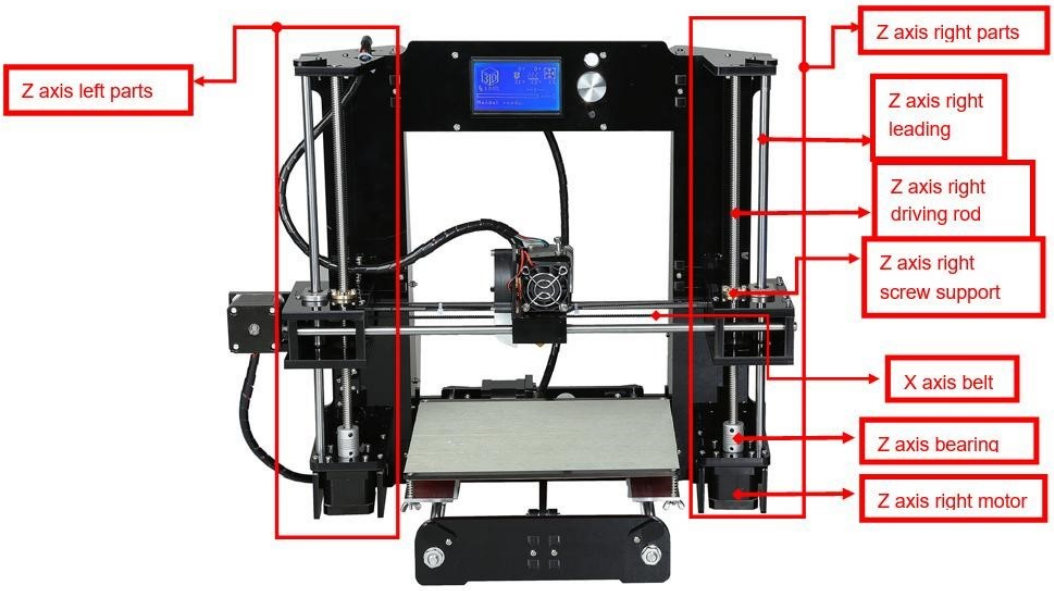


E. FAQ

1. Z Axis Ajustment

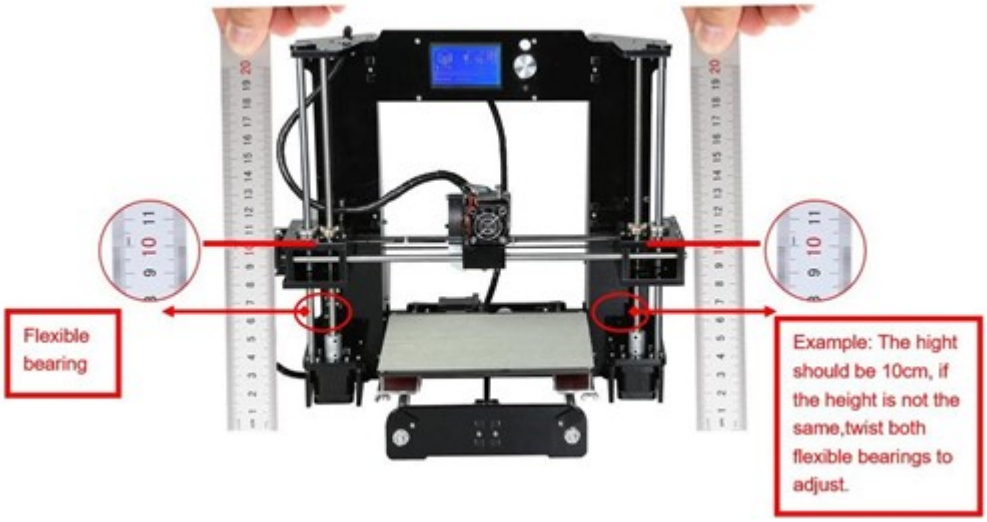
During installation, we need to test moving parts:

1.



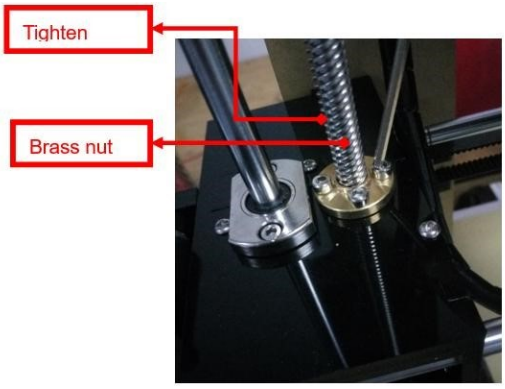
Use right Z axis for reference as shown above.
Reasons for Z axis's not smooth movement:
1. The height of both Z axis screw support is apprently different.
2. Large deviation of leading rod and motor rod'sconcentricity.
3. X belt is too tight.

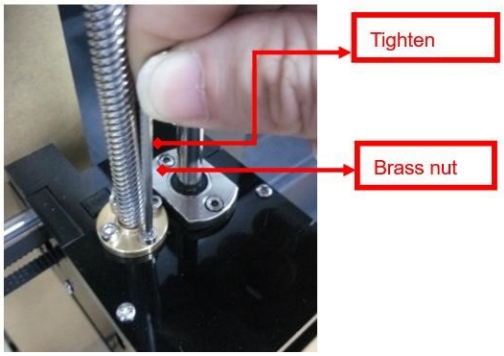
Preparation: Before Z axis moving adjustment, please confirm the height of both Z aixs screw support is the same. (Keep the same height of two white parts)



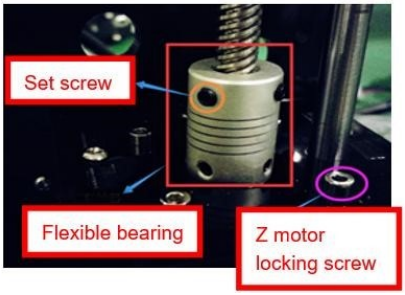
2. Ajust concentricity

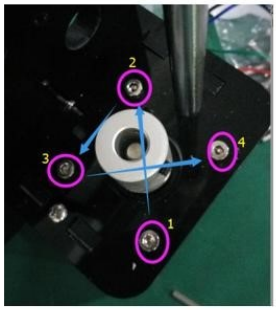
1. Click to adjust Z axis to move (Position → Z pos.Fast → +/-) . If it cannot move smoothly, you need to adjust the unsmooth side's screw support. Try to keep them at the same height.
2. We can also tight/loose the Z motor screw according to requirments. This is to correct the deviation in the first time installation. Please take steps as follows to lock screws,





Z axis left screw support Z axis right screw support

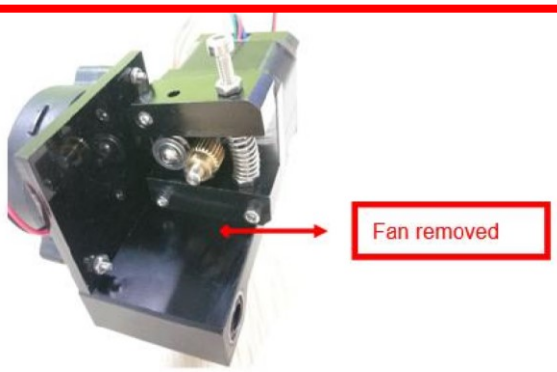




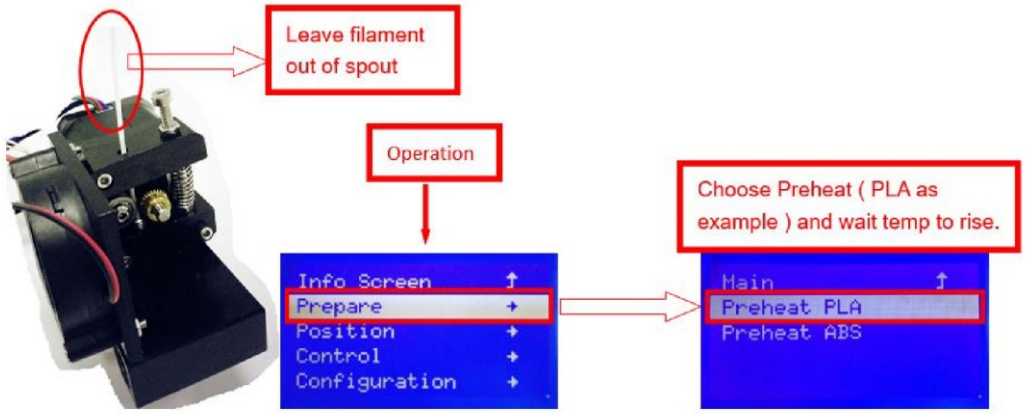
Z motor & Flexible bearing Z motor screw locking sequence

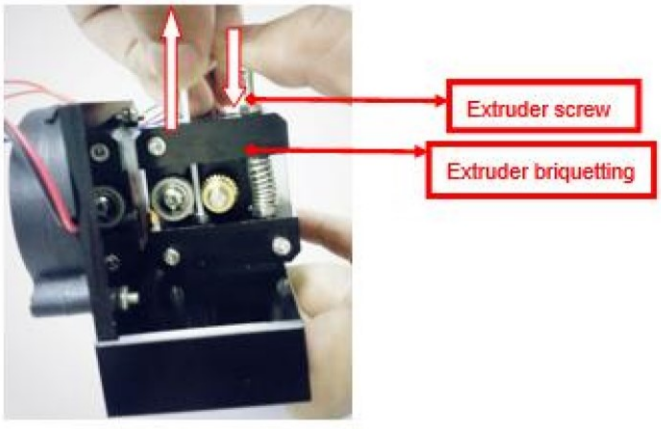
1. Nozzle blocking

Tips: We have removed fan to show obviously. Please cosider movement according

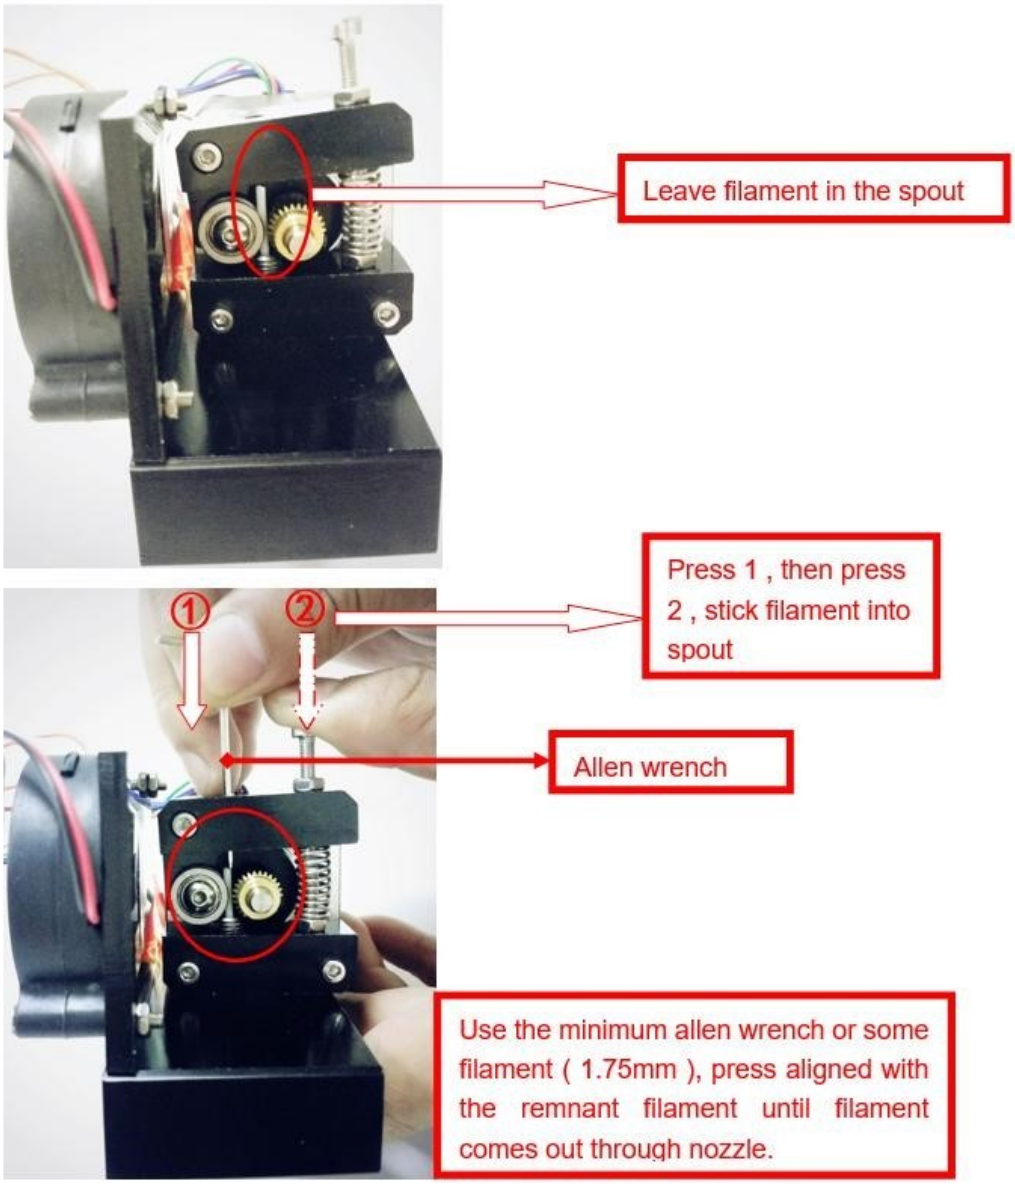


A. Only a little filament left in the nozzle and difficult to take out:





B. Filament full filled in spout



3.FAQ

No.	Symptom	Reason	Method
1	Print model dislocation	Synchronous wheel/belt loose.	Tighten set screws or fasten belt
2	Glitch with the print model	Too high temp or slicing problem.	Extruder temp is too high and retracting speed & distanse is too small
3	Foamy print model	Low temp or not smooth filament entering.	Rise extruder temp or check if brass nut and bearing is good. Replace a nozzle if methods above can’t solve the problem.
4	Printer model is warped	Hotbed level isn’t well adjusted.	Adjust hotbed
5	Unavaliable G-code tramsformation	Wrong setting/wrong save path	Choose right machine type and change the right path
6	Software installation failed	Different OS	Reset OS
7	Unusual temp	Broken temp sensor	Change a new one

4. Maintenance

Important maintenance tips:

1. maintenance of X,Y,Z axis: Add some lubricants on the rods to reduce friction when the machine works noisy and a little bit shake.

2. Please refer to the USER MANUAL before printing, do preparation of hot bed adjustment first.

3. When finished printing, the filament should keep sealing, avoid moisture.
4. Preheat the extruder at the beginning of 2 nd time printing, let extruder auto-push filament for a while.

5. Machine should do some regular maintenance, drop some lubricating oil on thread rod, polished rod and bearings to avoid fatigue wear.

6. Do not let the fan and air-condition blow to the hot bed when printing.
7. Keep the working condition at “Temp:10-30，Humidity:20-70%”.

5. Maintenance Service Provision

1. This product executes regulations of “Product Warranty Card”.
2. Please contact supplier or customer service if the product have any problems . Do not repair it by yourself, otherwise you need

   to bear all the consequences.
